

6.3.3.2. Contract Servicing Agents. When you plan to use civilian facilities for parking or servicing, refer to the worldwide merchant directory for the Multi Service Card via <https://www.airseacard.com>. Use the government fuel contractor unless you cannot obtain the required services. If your mission requires parking away from the contracted fueling ramp, try to arrange trucking of fuel/servicing at the parking spot; don't plan to taxi to the contracted fuel ramp solely for refueling. Use approved government credit card if you must purchase fuel from other than the designated government contract vendor.

6.3.3.3. Border Clearance. Missions entering or departing the United States will normally use a regular or special foreign clearance base, a civil international airport of entry (AOE), or a landing rights aerodrome as specified in the FCG. Military inspectors at special foreign clearance bases are only authorized to clear aircraft participating in the special projects listed for each base in the FCG. When aircraft not participating in the approved special projects require clearance, the special foreign clearance base commander must obtain advance approval from US border clearance officials in order to clear the aircraft. Aircraft must not transit a special foreign clearance base for clearance unless advance approval is confirmed. If the mission requires, arrangements can be made to use any suitable CONUS airfield, but the PIC must coordinate border clearance inspections with all appropriate government agencies in advance. Refer to the FCG, classified FCG, and applicable AFIs.

6.3.3.4. Security Support. Standard message formats include security support. If RAVENs are assigned to the mission, the senior RAVEN NCO can assist in arranging support. However, security support arrangements are the PIC's responsibility. If additional aircraft security support and/or threat suppression is required, the PIC should contact the applicable tasking agency for assistance.

6.3.3.5. Aircrew Billeting. Crew integrity is a mission requirement. PICs must know where their crewmembers are at all times. Itinerary changes are common and often require immediate action by crewmembers. To provide crew control, all crewmembers should be billeted at the same facility at en route stops. The PIC must have a "class A" or equivalent phone in the room. The mission contact officer/escort and the CP controller must know the location of the crew and how to contact them. Crew integrity does not require the whole crew to be billeted together in a BOQ. "Billeted at the same facility" means billeted on the same base or at the same hotel complex; however, if the whole crew is not together, the EAC must have a room phone. When government quarters are available, but not suitable, use an AF Form 2282, *Statement of Adverse Effect - Use of Government Facilities*, to justify the non-use.

6.3.3.6. Cabin Service. Determine if meal/beverage service is desired. Arrange for the 1st FA to call the contact officer directly to coordinate menus and other cabin service requirements.

6.3.3.6.1. The PIC normally should not discuss meal requirements with the contact officer. If the mission flight attendant is not available, the PIC should ask the FA scheduler to make contact and pass on the requirements to the 1st FA.

6.3.3.6.2. Confirm payment arrangements for meals and beverage service. If charges will be billed, obtain the complete billing address. If a mission cancels (at the request

of the using agency) after the FA has purchased supplies, the FA will advise the contact officer to the costs of all non-returnable items.

6.3.3.7. Advance Per Diem. Normally, advance per diem will not be paid to crewmembers, they are expected to use their government provided credit cards. When the mission requires an advance that is too large to reasonably collect from an automatic teller, the squadron administration section will assist in arranging advance per diem payments. On missions where substantial cash payments are anticipated for aircrew transportation and other incidental official crew expenses, the PIC will designate a transportation officer to receive an additional advance and be responsible for these payments. Refer to the Joint Federal Travel Regulation (JFTR) for information about per diem rates and procedures to follow when applying for special per diem allowances.

6.3.3.7.1. **(Added-MACDILLAFB)** Paying Agent. On missions where substantial cash payments are anticipated for aircraft related expenses, the aircraft commander will designate a paying agent for the mission. That individual shall check with the administration section (310 AS/CCE or CCS) to ensure their name appears on the squadron's roster of appointed paying agents. If not included on the roster, an appointment letter will be prepared by 310 AS administration. The paying agent should advise the Financial Services Office (FSO) cashier's cage one day prior to pickup denoting amount, time of pickup, and denominations required. Prior to departure, the paying agent will report to Finance with a suitable container to carry the funds. For amounts greater than \$7,500, an escort is required when leaving the vault. The escort can be a member from Security Forces or a crewmember. On the return leg to MacDill AFB, advise the Command Post to notify the FSO and ensure personnel are available for the return of funds on arrival. Ensure paying agent is fully aware of duties and responsibilities.

6.3.4. Other planning factors:

6.3.4.1. The SOC serves as POC between current operations, mission execution authority, and crewmembers. Contact unit SOC for coordination with current operations or mission execution authority during mission planning and itinerary changes.

6.3.4.2. All VIP Missions are considered "FOR OFFICIAL USE ONLY" and crewmembers will not discuss the mission or any DV information with anyone without a need to know. Unclassified missions may be designated "CLOSE HOLD". In this case, certain mission details are restricted from normal release to military/non-military agencies/contracted dispatch. Clarify the applicable restrictions with unit C2 centers and mission execution authority prior to any mission planning or coordination activities.

6.3.4.2.1. **(Added-MACDILLAFB)** Public Affairs Actions. Aircrew members will not grant interviews or provide information to members of the press or other media unless the interview has been approved by the 6 AMW/CC or designated Public Affairs (6 AMW/PA) representative (6 AMW/PA representatives should be available through MacDill Command Post). If 6 AMW/PA decides to pursue the interview, they will obtain 6 AMW/CC approval. When 6 AMW/CC has approved an interview, the 310 AS/CC will be notified. This approval will be routed to crewmembers as needed. Military public affairs personnel or media representatives at other bases may not be familiar with 6 AMW media restrictions. Advise them to

contact 6 AMW/PA. In any case, all aircrew members will notify the 310 AS/ DO or 310 AS/CC regarding any media requests.

6.3.4.3. Confirm the aircraft tail number with the contact officer. Obtain the contact officer's home/cell telephone number and provide him/her with the PIC's home/cell telephone number. Notify unit C2 if the contact's name or phone number is different from the one listed with the SOC/CP printout.

6.3.4.4. Prearrange your pre-departure weather briefing (DV weather package, "social", etc.) IAW local supplement. Provide all details needed to prepare your weather briefing. Do not request (DV weather package, "social", etc.) for "CLOSE HOLD" missions.

6.3.4.4. **(MACDILLAFB)** The aircrew should notify the MacDill AFB weather office (6 OSS/OSW) of specific requirements, at a minimum, one duty day prior to departing home station.

6.3.4.5. VIP aircrews will prearrange special communications support as follows:

6.3.4.5.1. High Frequency Global Communications System (HFGCS, formerly known as Mystic Star)/Andrews Very Important Person (VIP) HF support is required for all missions transporting the Secretary of Defense. HFGCS support is also available on a priority basis for aircraft transporting the Vice President, cabinet members, service secretaries, and service chiefs of staff. When HFGCS/Andrews VIP support is required, the CSO will ensure appropriate agencies are notified. Last minute requests at crew show time are not acceptable. For alert missions, the PIC will request the unit CP or AMD controller to arrange coverage.

6.3.4.5.2. FM radio support is provided by the White House Communications Agency (WHCA) IAW established priorities.

6.3.4.5.3. Current procedures for use of the HFGCS network and the WHCA FM networks are described in the 89 OG/CC Special Communications Support Procedures Package available in each mission kit and at the SOC.

6.3.4.5.4. Denial of service from Andrews Airways. When denied service from Andrews Airways due to higher priority traffic and the aircraft is working another airways station, inform 89 AW CP which station you are working.

6.3.4.5.5. Denial of service from WHCA. When denied service from WHCA on White House missions with a Secure Communications Required profile, notify SOC and advise them to contact current operations and CVAM immediately.

6.3.4.5.6. Prior to transiting an AOR with special communication requirements, the PIC should contact the unit Intelligence or Tactics office for AOR communication plan and, as applicable, ATO integration.

6.3.4.5.7. CSOs will need to coordinate with Commercial Satellite Service Providers via the Government Network Operations Center (GNOC) IAW [paragraph 1.4.3](#) of this AFI for accessibility to the Executive Airlift Communications Network (EACN).

6.3.4.5.8. Crews will notify contact officer of aircraft capabilities and the costs associated with the respective systems.

6.3.4.6. Arrange for spare parts as required. PICs on extended overseas missions to areas where support facilities are limited may request certain spares be issued for a particular trip. Coordinate requirements with C2 agencies and maintenance control personnel.

6.3.5. Not Used.

6.3.6. Itinerary Coordination. Use the following procedures when confirming and planning itinerary details:

6.3.6.1. Preposition for DV pickups. Plan to preposition for DV pickups two hours prior to the scheduled departure time (or as directed by local supplement/directives). PICs may request to preposition the night prior to an early morning pickup depending on aircraft and crew availability. Early preposition may also be requested to allow adequate crew rest prior to an extended crew duty day. Coordinate request for early preposition with unit C2.

6.3.6.1. **(MACDILLAFB)** Preposition for DV pickups. At the aircraft commander's discretion, preposition time for DV pickups can be reduced to 1+30 hours prior to scheduled departure time. Special consideration will be given to ensure mission requirements are balanced with ORM considerations and coordinated with 310 AS/DO.

6.3.6.2. Configurations. Aircraft configuration requirements originate with the mission execution authority through unit C2. If the using agency requests a change in the configuration shown on the mission printout, the contact officer must coordinate with CVAM/AMD. PICs cannot accept aircraft configuration changes directly from the using agency. Advise the contact officer to coordinate with the mission execution authority and notify unit C2 of the pending request.

6.3.6.3. Manifest Information. The PIC will coordinate with the contact when manifested passengers are not present at departure time. PICs shall designate a crewmember to review manifests for accuracy prior to mission departure. PIC's will not depart without primary DV onboard unless authorized by C2.

6.3.6.3.1. **(Added-MACDILLAFB)** Passenger Manifests. Aircraft commanders will ensure that the Communications System Operator (CSO) transmits the passenger manifest to the MacDill Command Post prior to departure or as soon as possible after departure.

6.4. Aircrew Publications Requirements. As a minimum, PICs will carry current copies of AFI 11-202V3 and this AFI on all flights. Additionally, the PIC will ensure the aircraft has a complete set of current FCMs. All must be readily available in the cockpit during all phases of flight. MAJCOM/A3 with mission execution authority approval is required to use electronic publications in lieu of paper manuals. All other crew positions must carry the appropriate abbreviated checklists. Additional individual aircrew publications requirements will be specified in local supplements.

6.4. (MACDILLAFB) Aircrew Publications Requirements. Due to space limitations on the C-37A, the following publications, Flight Crew Manuals (FCM), and checklists will be maintained as hard copy on-board the aircraft.

6.4.1. **(Added-MACDILLAFB)** Aircraft Flight Manuals (AFM).

6.4.2. **(Added-MACDILLAFB)** Aircraft Operating Manuals (AOM).

- 6.4.3. **(Added-MACDILLAFB)** Aircraft Performance Manuals.
- 6.4.4. **(Added-MACDILLAFB)** Communications System Operator (CSO) Handbook.
- 6.4.5. **(Added-MACDILLAFB)** Abbreviated Checklist (applicable crew positions).
- 6.4.6. **(Added-MACDILLAFB)** AFI 11-202V3, *General Flight Rules*.
- 6.4.7. **(Added-MACDILLAFB)** AFI 11-2VIPV3 (including local unit supplement).
- 6.4.8. **(Added-MACDILLAFB)** C-37A Minimum Equipment List (MEL).
- 6.4.9. **(Added-MACDILLAFB)** Cabin Operating Manual.
- 6.4.10. **(Added-MACDILLAFB)** Maintenance and updates of all aircraft publications will be accomplished by 310 AS/DOV. All crewmembers will fly with their squadron-issued thumb-drive (or other AF-approved media) with a current and complete e-pubs folder, encompassing all crew positions. Current e-pubs may be found on the 310 AS Network Drive, the 310 AS/DOV stand-alone computer, or the internet at the 6 OG/OGV SharePoint site (<https://eim.amc.af.mil/org/6og/StanEval/default.aspx>). The current e-pubs date is listed on the most recent Flight Crew Information File (FCIF) or found on the aircrew flimsy under the Plexiglas near the hard-copy FCIF Library by the SOC counter.

6.5. Airfield Review. All crewmembers will review Airport Qualification and Familiarization Manuals, audiovisual slide tape programs and review any certification airfields available prior to departure. In addition, aircrews will review appropriate websites, (e.g. AMC Aircrew Portal, CENTAF AOR CAOC) for all restrictions and certification policies for a particular airfield. Contact MAJCOM Airfield Suitability and Analysis Branch for all questions pertaining to airfield weight bearing and suitability prior to all off-station operations. Airfield suitability waivers must be coordinated through unit Stan/Eval to MAJCOM/A3 with mission execution authority for approval. The OG/CC or equivalent may waive the airfield certification requirement (special aircrew certification).

6.6. Aircrew Intelligence Briefing and Tactics Support. Before leaving home station on missions traveling OCONUS (except Alaska and Hawaii), crews will receive an intelligence briefing that will emphasize terrorist, enemy, and friendly political and military development in the area in which they will be flying. Crews must also receive an intelligence brief prior to entering specific AOR. As a complement to the intelligence briefing, the PIC should review and coordinate necessary tactics with the theater and/or unit Tactics office. In theater, aircrews should receive intelligence updates on initial arrival at a forward operating location, or en route stop, and thereafter when significant developments occur. Report information of possible intelligence value to the local intelligence officers as soon as possible to ensure timely dissemination of mission reports (MISREP). In addition, the PIC should provide the Tactics office with feedback on tactical considerations.

Section 6B—Pre-departure

6.7. Not Used.

6.8. Flight Crew Information File (FCIF) Procedures.

6.8.1. Review FCIF, volume 1 (index and safety-of-flight files, as a minimum), before all missions or ground aircrew duties. Update the FCIF currency record with the latest FCIF item number, date, and crewmember's initials or as specified.

6.8.1.1. **(Added-MACDILLAFB)** Upon arrival to the squadron, each crewmember will place his/her initials by their name on the aircrew flight authorization at the SOC counter. This will inform the aircraft commander that the crewmember is present for duty and that the most recent FCIF has been signed off, the Human Factors ORM Assessment has been completed, and that the crewmember's E-pubs are current. Aircrew will use Patriot Excalibur (PEX), or other Major Command (MAJCOM)-approved software program, as the primary means of reviewing and signing off required FCIFs prior to flight. FCIFs loaded into PEX will reflect exactly what is in the current Read File. If PEX is unavailable, crewmembers will include the latest FCIF number to the right of their name on the aircrew flight authorization to signify review of the required FCIFs.

6.8.2. Crewmembers delinquent in FCIF review or joining a mission en route will receive an FCIF update from a primary aircrew member counterpart on the mission. Instructor pilots who fly with general officers are responsible for briefing appropriate FCIF items; the instructor pilot should initial the general's FCIF card.

6.8.3. Crewmembers not assigned or attached to the unit operating a mission will certify FCIF review by entering the last FCIF number and their initials behind their name on the file copy of the flight authorization.

6.8.4. Squadrons are responsible for ensuring TDY aircrews receive newly released FCIFs which may result in mission impact.

6.9. Flight Crew Bulletins (FCB).

6.9.1. FCBs are issued under provisions of AFI 11-202V2 and MAJCOM supplements. Operations Group Stan/Eval will be the Office of Primary Responsibility (OPR) for FCBs. Items in FCBs may include local supplement and policies concerning equipment and personnel generally not found in any other publications.

6.9.2. All crewmembers should be cognizant of FCB contents.

6.10. Mission Kits. Carry mission kits (hard or electronic copy) on all operational missions. Mission kits will contain all forms and publications necessary for safe and efficient conduct of the mission. Squadron stan/eval will determine and publish the contents of the mission kit/mission computer by specific MDS aircraft type. Suggested items include:

6.10.1. Publications.

6.10.1.1. AFI 11-401, *Aviation Management*.

6.10.1.2. DESC-I-31 (Defense Energy Support Center Interim Policy Guidance), *Purchase of Aviation Fuel and Services at Commercial Locations* (previously AFI 23-202, *Buying Petroleum Products and Other Supplies and Services Off-Station*).

6.10.1.3. AFJ 11-204, *Operational Procedures for Aircraft Carrying Hazardous Materials*.

6.10.1.4. AMCI 11-208, *Tanker/Airlift Operations* (AMC/AMC-gained aircrew only).

6.10.1.5. AFI 31-104, *Air Force RAVEN Program* (including appropriate MAJCOM supplements).

6.10.1.6. Airfield Suitability and Restrictions Report (ASRR).

6.10.1.7. AMC Aircrew Border Clearance Guide.

6.10.1.8. Flight Crew Bulletin (FCB).

6.10.1.9. ATP-56, *NATO Air to Air Refueling* (VC-25 only).

6.10.2. Forms.

6.10.2.1. DD Form 175, *Military Flight Plan*

6.10.2.2. DD Form 1351-2, *Travel Voucher or Sub-voucher*

6.10.2.3. DD Form 1351-2c, *Travel Voucher or Sub-voucher (Continuation Sheet)*

6.10.2.4. DD Form 1801, *DoD International Flight Plan*

6.10.2.5. DD Form 1854, *US Customs Accompanied Baggage Declaration*

6.10.2.6. DD Form 2131, *Passenger Manifest*

6.10.2.7. AF Form 15, *United States Air Force Invoice*

6.10.2.8. AF Form 457, *USAF Hazard Report*

6.10.2.9. AF Form 651, *Hazardous Air Traffic Report (HATR)*

6.10.2.10. AF Form 711B, *USAF Mishap Report*

6.10.2.11. AFTO 781, *ARMS Aircrew/Mission Flight Data Document*

6.10.2.12. AF Form 1297, *Temporary Issue Receipt*.

6.10.2.13. AF Form 2282, *Statement of Adverse Effect - Use of Government Facilities*

6.10.2.14. AF Form 3211, *Customer Comments*.

6.10.2.15. AF Form 4031, *CRM Skills Criteria Training/Evaluation*

6.10.2.16. AF Form 4075, *Aircraft Load Data Worksheet*

6.10.2.17. AF Form 4085, *Mission Expense Record*

6.10.2.18. AMC Form 22, *AMC Passenger Survey*

6.10.2.19. AMC Form 43, *AMC Transient Aircrew Comments*

6.10.2.20. AMC Form 54, *Aircraft Commander's Report on Services/Facilities*

6.10.2.21. AMC Form 97, *AMC In-Flight Emergency and Unusual Occurrence Worksheet*

6.10.2.22. AMC Form 196, *Aircraft Commander's Report on Crewmember*

6.10.2.23. Customs Form (CF) 6059B, *Customs Form*

6.10.2.24. Customs Form (CF) 7507, *General Declaration (Outward/Inward) Agriculture, Customs, Immigration, and Public Health*

6.10.2.25. H.M.S. Customs Declaration.

6.10.2.26. Japanese Customs Declaration.

6.10.3. Orders.

6.10.3.1. DD Form 1610, *Request and Authorization for TDY Travel of DoD Personnel*

6.10.3.2. AF Form 1631, *NATO Travel Order/Ordre De Mission OTAN* (when required).

6.10.3.3. AMC Form 41, *Flight Authorization*

6.10.4. MAJCOM approved Computer Programs.

6.10.4.1. Weight and Balance Software

6.10.4.2. Flight Planning Software

6.10.4.3. Performance Software.

6.10.5. Miscellaneous

6.10.5.1. Box car seals.

6.10.5.2. Masking Tape. **NOTE:** The PAG/CC determines the contents for PAG mission kits. Refer to MAJCOM or local supplement for mission additional kit contents.

6.11. Route Navigation Kits. The PIC and navigator, if applicable, are jointly responsible for the contents of route navigation kits. Kit contents are determined by the mission itinerary. Include all publications, charts, and forms required to fly the mission and comply with all FLIP and FCG requirements. Route navigation publications, charts, and forms for areas of routine operations may be kept on the aircraft. PICs will verify the currency of route navigation publications prior to departure from home station.

6.11.1. Aircraft Route Navigation Kits. The route navigation kits maintained on each aircraft include sufficient FLIP charts, approach booklets, Standard Instrument Departures (SID)/Standard Terminal Arrival Routes (STAR) and supplements for any local or OCONUS mission. Aircrews without a navigator position will carry and maintain only one set of enroute charts, one set of DoD area arrival charts, and one IFR supplement. Two sets of enroute charts/DoD area arrival charts are authorized for those aircraft maintaining a navigator position. Units issuing laptops to aircrews with updated electronic FLIP planning documents do not have to issue paper versions. Specific unit procedures are in local supplement.

6.11.1. **(MACDILLAFB)** Aircraft Route Navigation Kits. Prior to departing home station, the aircraft commander will ensure the aircraft flight publications are current. If departing on an Outside the Continental United States (OCONUS) mission, the aircraft commander/pilot will ensure required Flight Information Publication (FLIP) is on hand and/or contact Combat Crew Communications office to obtain FLIP. Aircraft commanders may use approved Jeppesen paper or electronic JeppView products in accordance with 310 AS Standard Operating Procedures (SOP).

6.12. Briefing Requirements.

6.12.1. Pre-mission Briefings. Before departing home station, the PIC will schedule and conduct a pre-mission briefing. The PIC will brief crewmembers on all aspects of the

mission using OG/OGV or unit stan/eval developed and approved briefing guides, omit items that do not apply. As a minimum, at least one person from each crew position will attend the pre-mission briefing.

6.12.1. **(MACDILLAFB)** 6 OG approved briefing guides may be found in [Attachment 2](#) of this supplement. Any suggested changes to these guides may be sent to 310 AS/DOV for further review and subsequent forwarding to 6 OG/OGV.

6.12.1.1. The necessity of pre-mission briefings for short notice, standby/alert, or one day missions will be at the PICs discretion. In this case, ensure all required information has been passed to the appropriate crewmembers.

6.12.1.2. Use the following checklist as a guide for home station pre-mission briefings:

6.12.1.2.1. Mission Requirements. Mission number, aircraft number, DV name and title, passenger load, itinerary, departure time and crew reporting.

6.12.1.2.2. Intelligence. Political/military situation, airfield threat/security situation, terrorist or other threat advisories.

6.12.1.2.3. Tactics. If required IAW Intelligence briefing and/or AOR guidance, review applicable AOR/airfield procedures and AFTTPs with crew members.

6.12.1.2.4. Special Requirements. Honors arrivals/departures, press, special FCG requirements, and special immunizations.

6.12.1.2.5. Personal Requirements. Aircrew uniform/civilian clothing, passports, shot, records, FCIF review, billeting arrangements, protective/survival gear.

6.12.1.2.6. Normal Procedures. Cockpit discipline, communication with DV party, (only PIC will brief contact officer on mission details, block times, adverse weather, etc.), aircraft cleanliness, student responsibilities, aircrew transportation (transportation officer), aircrew baggage security, un-manifested packages, sabotage/stowaway surveillance, hijacking, aircraft security, and surveillance for narcotics.

6.12.1.2.7. Emergency Procedures. As a minimum, discuss general communication and provide scenario discussion for Emergency Procedures pertaining to the mission. The PIC and FA (First FA for multi-FA crew) will verbally agree on the “Signal to Brace” call and “Signal to Evacuate” call during the pre-mission crew brief.

6.12.1.2.8. Crew Duties and Responsibilities. Designate EAC and review duties (supervision, crew location during crew rest, communication on mission changes). Designate crewmember responsible for passports, trip/NAV/Crypto kits, etc. FA duties include cabin service requirements, crew meals, and crew payment arrangements. RAVEN duties include duty schedule, review aircraft access policies, brief FCG firearms restrictions. FCC duties include fuel loads, aircraft configuration, and en route maintenance. If transiting a threat environment, review and assign specific lookout doctrine and combat entry and exit checklist duties to appropriate crew members.

6.12.1.2.9. Crew Conduct. Review personal conduct in foreign areas and personal article security on aircraft.

6.12.2. En Route Briefings. Conduct crew briefings en route as required. Prior to entering crew rest, the PIC will brief the crew on the requirements for the next mission leg. Route and leg briefings should be conducted for every leg prior to departure with applicable crewmembers or a designated representative for each crew specialty. PICs should keep on-board contacts informed of mission specifics, changes, problems, etc. Use the following checklist as a guide for en route briefings:

- 6.12.2.1. Crew contact procedures during crew rest.
- 6.12.2.2. Departure time.
- 6.12.2.3. Crew reporting time and place (transportation arrangements).
- 6.12.2.4. Fuel load.
- 6.12.2.5. Uniform changes, if applicable.
- 6.12.2.6. FA cabin service requirements.
- 6.12.2.7. Aircraft security requirements.

6.12.3. CP Briefings. At show time, the PIC or designated crew representative should contact the Unit CP or AMD prior to departure for any last minute changes, aircraft status or crew/passenger messages.

6.12.4. Weather Briefings. See AFI 11-202V3 requirements. Obtain a briefing on current weather, trends, and forecasts for the proposed route, destination, and alternates. The weather briefing may be documented on a DD Form 175-1, *Flight Weather Briefing*, AMC Form 181, *AMC Mission Weather Briefing*, IFM/Contract Dispatch crew paper weather briefing, or other MAJCOM approved form. **EXCEPTION:** Verbal weather briefings are acceptable for local area training missions.

- 6.12.4.1. Approved weather sources. US Military weather services, FAA-approved (Dispatch, Jeppesen, Flight Service, etc.), or any host nation civil or military weather source are considered approved weather sources.

6.12.5. NOTAM information is permitted from the following sources: US Military services, any FAA-approved source (Dispatch Services, Jeppesen, Flight Service, etc.), or any host nation civil or military source.

6.12.6. Buffer Zone. Prior to operating an aircraft within or adjacent to an established buffer zone, the PIC will ensure primary crewmembers are briefed on current buffer zone procedures outlined in appropriate directives.

6.12.7. Peacetime and Wartime SAFE PASSAGE Procedures. Pilots must be familiar with peacetime and wartime safe passage of friendly military aircraft (if applicable).

6.12.8. Intelligence and Tactics. Receive an updated intelligence briefing and, if appropriate, update the crew on changed intelligence reports and associated tactics.

6.13. Call Signs.

6.13.1. During radio transmissions, crews use filed ATC call sign. Reference local supplement for local unit call signs.

- 6.13.1. (MACDILLAFB) Static voice call signs.

Table 6.3. (Added-MACDILLAFB) Static Voice Call Signs.

Aircraft	Local	Msn CONUS/OCONUS*
10028	Flash 28	Spar 28/Spar XX
10029	Flash 29	Spar 29/Spar XX
10030	Flash 30	Spar 30/Spar XX
*OCONUS missions: 6 OSS/OSOC will assign a 25-35 (excluding 28, 29, & 30) series call sign (Spar 25-27, 31-35).		

6.13.2. For OPSEC and tactical purposes, the PIC may coordinate for call sign change with applicable C2.

6.13.2. **(MACDILLAFB)** The following call signs will be used when 6 AMW senior leadership is on-board: 6 AMW/CC – Flash 01; 6 AMW/CV – Flash 02; 6 OG/CC – Flash 03.

6.13.3. All call sign changes will be accomplished IAW AFI 33-217, *Voice Call Sign Program*.

6.14. Instrument Flight Rules. Conduct flight operations under IFR to the maximum extent possible without unacceptable mission degradation. **EXCEPTION:** On training flights, VFR flight rules, VFR terminal area procedures, and visual patterns will be reviewed, practiced and de-briefed to ensure aircrew VFR flight proficiency and knowledge of VFR procedures and rules are maintained.

6.15. Flight Data Verification.

6.15.1. Aircrews should acquaint themselves with the mission and individual sortie requirements to ensure successful mission accomplishment. Wing, group and squadron staff should monitor crew activity and be available to resolve problem areas.

6.15.2. Only MAJCOM approved CFPs are to be used for aircraft operations. Approved flight planning programs include Advanced Computer Flight Plan (ACFP), Jeppesen, PFPS, and those used by CDS. Every effort should be made to ensure each mission segment has the current wind data.

6.15.3. Flight crews may manually compute flight plans. However, CFPs should be utilized to the maximum extent practical. The flight crew has final responsibility for accuracy of the flight plan used.

6.15.4. Flight crews will verify diplomatically-cleared route and fuel computation for accuracy prior to departure. Range summary charts should be used to confirm CFP fuel burn rates.

6.15.5. TOLD will be verified IAW the FCM. As a guide, at least two crewmembers should verify data entry into the FMC/FMS. Use of MAJCOM approved contracted performance programs is authorized.

6.15.5. **(MACDILLAFB)** Air Mobility Command, Standardization and Evaluation (AMC/A3V) has approved Tybee Jet Corporation AFMATIC software for operational use in the C-37 aircraft. 310 AS/DOV is responsible for maintaining current AFMATIC software on applicable computers.

6.15.6. **(Added-MACDILLAFB)** ACs and FEs will utilize the Weight and Balance Clearance Form F to ensure proper weight and balance. These forms will be maintained onboard each aircraft and additional copies will be located within the Weight and Balance Book located by the SOC Counter. Basic Operating Weight is provided by Gulfstream and the 6 OG/OGV FE will maintain/update the Form F as required by T.O. 1-1B-50, *Weight and Balance*.

6.16. Departure Planning. Use AFI 11-202V3, AFMAN 11-217V1, AFMAN 11-217V3, this chapter, and the appropriate MAJCOM supplements. Regardless of the type of departure flown (IFR/VFR), review the following (as appropriate): IFR Departure Procedure, instrument approach plate, NOTAMs, GDSS/GDSS2, ASRR Giant Report and suitable terrain charts. **NOTE:** One Engine Inoperative (OEI) climb performance calculations IAW procedures contained in FCMs is deemed by AFFSA to comply with the requirements of AFI 11-202V3, paragraph 8.7.2.2.

6.16. (MACDILLAFB) Departure Planning. During the mission planning process, 310 AS Flight Engineers will provide the Aircraft Commander with detailed, 'worse-case' AFMATIC print-outs concerning all potentially available departure runways for each destination airfield. Pilots and FEs will make every effort to coordinate aircraft performance limitations (e.g., taxi routing, Standard Instrument Departures (SID), obstacles clearance, Jeppesen procedures, etc.) prior to the formal crew briefing.

6.16.1. VFR Departures. **NOTE:** VFR departures will not be flown in lieu of obstacle clearance planning.

6.16.1.1. VFR departures are authorized when there is no authorized IFR departure method for the airport, when the aircraft cannot depart using one of the IFR departure methods contained in AFI 11-202V3 and AFMAN 11-217V1, when operational requirements dictate (i.e. tactical necessity), or when most of the mission is planned as a VFR flight for training. VFR departures require detailed planning to ensure obstacles and high terrain are avoided.

6.16.1.2. The minimum climb performance for VFR departures is determined by ensuring all the following conditions are met:

6.16.1.2.1. All-engine climb capability ensures obstacle avoidance along the departure route.

6.16.1.2.2. OEI climb capability shall ensure departure or emergency return route provides obstacle avoidance. **NOTE:** If unable to comply with any of the above conditions, download cargo/fuel or delay until conditions that are more favorable exist.

6.16.1.3. Refer to FLIP for host nation VFR requirements before flying VFR outside of CONUS.

6.16.1.4. When departing VFR, maintain VFR cloud clearances until obtaining an IFR clearance or reaching the IFR MEA.

6.16.2. IFR Departures: Aircrews must use an approved IFR departure method as outlined in AFI 11-202V3 and AFMAN 11-217V1.

6.16.2.1. If the airport does not have an authorized IFR departure method, depart VFR IAW [paragraph 6.16.1](#) of this AFI. An IFR departure is not authorized at airfields without an instrument approach.

6.16.2.2. IFR departures require detailed planning to ensure obstacles and high terrain are avoided. Adhere to screen height/departure end of runway (DER) requirements for IFR departure planning in AFMAN 11-217V1.

6.16.2.2.1. Runway End Crossing Height or Screen Height is the aircraft's required AGL altitude at the Departure End of the Runway (DER). The OCS slope begins at the DER at the runway end crossing height. Determining and complying with the proper runway end crossing height is crucial to preventing unsafe operations below the OCS. Runway end crossing heights vary depending on location of the airport, who designed the procedure, terrain, obstacles, etc. The parenthetical notation at the top of DoD approach plates cannot reliably be used to determine what rules were used to produce a departure procedure and screen heights are not consistently published in the ODP section of the approach plates. USAF pilots will only consider the type of airfield when determining runway end crossing height: USAF/USN non-joint-use and all others (Civil/Joint Use/ICAO/NATO/etc.). Consult the IFR Supplement or other appropriate FLIP for this information. Joint use airfields will be annotated as "MIL/CIV". If an airport is listed as an AFB or NAS and does not include "MIL/CIV" in the listing, then it is non-joint-use.

6.16.2.2.1.1. USAF/USN non-joint-use bases: The OCS at USAF and USN bases normally begins at zero feet AGL at the DER, but the OCS may be raised as much as 35 feet in order to clear obstacles. If the TERPS specialist raises the OCS, it will be published in the ODP. At non-joint-use USAF or USN bases, assume a zero foot runway end crossing height unless a higher altitude is published.

6.16.2.2.1.2. Other than USAF/USN non-joint-use bases (Civil/ICAO/NATO/etc.): If civil aircraft certification standards mandate, or obstacles penetrate the OCS, TERPS may raise the runway end crossing height up to 35 feet to maintain a normal 200'/NM climb gradient. There is no reliable way, from looking at the DoD/NACO FLIP, to know if TERPS raised the OCS or not. Therefore, for any departure at other than non-joint-use USAF or USN bases, if the screen height is not published in the ODP or other reliable source, pilots will plan to cross the DER at or above 35 feet.

6.16.2.2.1.2.1. There is no provision for a runway end crossing height greater than 35 feet. If a runway end crossing height of 35 feet does not eliminate all penetrations of the 40:1 OCS, then a higher than standard (i.e. >200 ft/NM) climb gradient will be published on the departure.

6.16.2.2.1.2.2. If in doubt, or the 35 foot restriction limits mission capability, contact the appropriate TERPS authority for the airfield. If further help is required, contact the USAF Instrument Procedures Center at DSN 339-8300 or commercial (405) 739-8300.

6.16.2.2.1.3. Special Departure Procedure (SDP): Published on SDP.

6.16.2.3. Aircraft must meet the published climb gradient for the departure runway with all engines operating. If no minimum climb gradient is published, 200 ft/nm will be used. **NOTE:** In the event the aircraft is unable to meet the published ALL ENGINE climb gradient, download cargo/fuel or delay until more favorable conditions exist.

6.16.2.4. Use one of the following methods to ensure the aircraft can vertically clear all obstacles along the planned departure route with OEI:

6.16.2.4.1. Special Departure Procedures (SDP). HQ AMC/A3V (lead command) authorizes the use of Jeppesen or CDS provided SDP's for VIP Aircraft. SDP's utilize worldwide obstacle database criteria to calculate OEI emergency gross weights, flap settings, and provide escape routing. SDP's and associated OEI obstacle routings (Takeoff Procedures) provide optimum dispatch takeoff weights at specified departure locations. Each must be specifically designed for your MDS. SDP's must be current. If obstacle NOTAM affects SDP routing, do not use the SDP. Aircrew must use the FCM and/or computer based performance tools for OEI departure planning. Verify aircraft OEI climb gradient will clear all obstacles along the planned flight path. **NOTE:** Use of SDP's as alternate departure routing (no emergency) is not authorized.

6.16.2.4.2. Minimum climb gradient. The TERPS standard minimum climb gradient is 200 ft/nm, which is based on the standard obstacle clearance surface (OCS) of 152 ft/nm plus the required obstacle clearance (ROC) of 48 ft/nm. If an SDP is not available, the crew must ensure compliance with any obstacle-based minimum climb gradients for the selected departure, with OEI. Minimum climb gradients may be published as a 'Trouble T' restriction in the IFR Take-off Minimums section of FLIP or on a SID. When required for mission accomplishment, crews may subtract 48'/nm from published climb gradients before computing OEI takeoff data. Minimum climb gradients do not take into account low, close in obstacles (obstacles or terrain 200' AGL and below) which should normally be published as a NOTE on the SID or IFR departure procedure (Trouble T). Crews must also ensure the aircraft can clear these close in obstacles. **NOTE:** If the requirements of [paragraph 6.16.2.4](#) of this AFI cannot be met, download cargo/fuel or delay until more favorable conditions exist.

6.16.3. Tactical Departure Procedures. If transiting an AOR and airfield with TAAD procedures, the PIC should review these procedures and apply tactics IAW applicable AFTTPs.

6.17. Weather Minimums for Takeoff. Departures with weather below landing minimums are authorized IAW AFI 11-202V3, chapter 8. When weather is below approach and landing minimums (ceiling and visibility), a departure alternate is required (see [paragraph 6.19](#) of this AFI).

Table 6.1. Takeoff Weather Minimums.

Mission	Visibility	Remarks
---------	------------	---------

Operational (Note 2)	RVR (Runway Visual Range) 600 (200 meters)	When less than RVR 1600, but equal to or greater than RVR 600, the crew may take off if mission priority dictates, provided the runway has a minimum of 2 functioning RVR readouts (minimum RVR 600 on all functioning readouts) and runway centerline lighting is operational. When 3 transmissometers are installed, all are controlling.
All Others (Note 1)	RVR 1600 (490 meters)	For runways with more than one operating RVR readout, RVR must read 1600 minimum on all.

NOTES:

1. In the absence of RVR readouts, reported visibility will be no lower than 1/2SM (800 meters).
2. If the runway has only one functional RVR readout or no centerline lighting, the minimum RVR is 1600.

6.18. Alternate Planning. Select alternate airports meeting the requirements of AFI 11-202V3. Choose alternates that best meet mission requirements and conserve fuel; they should not be within the same terminal area, if terminal forecasts are marginal. Select alternates that are not restricted by FLIP, FCG, or diplomatic clearances, and are compatible with the mission load and performance characteristics of the aircraft. The PIC retains final authority in the choice of alternates; however, selection by support agencies normally should be used if they meet the above criteria and the aircraft has already been serviced.

6.19. Departure Alternates.

6.19.1. A departure alternate is required if ceiling or visibility is below landing minimums for an available approach (at departure aerodrome). Do not use CAT II/III ILS minimums to determine if a departure alternate is required.

6.19.2. Suitability of Departure Alternates. When a departure alternate is required, the aircraft must be capable of maintaining the Minimum Enroute Altitude (MEA) or Minimum Obstruction Clearance Altitude (MOCA), whichever is higher, to the alternate using OEI performance criteria. To qualify as a departure alternate, the airfield must meet one of the following conditions:

6.19.2.1. Existing weather at an alternate within 30 minutes flying time must be equal to or better than the published approach minimums and forecast to remain so until 1 hour after takeoff, but in no case forecast to be lower than 200-1/2 (RVR 2400/730m), or;

6.19.2.2. The existing weather at an alternate within 1 hour flying (C-9, C-20, C-32, C-37 and C-40) or 2 hours flying time (VC-25) must be at least 500-1 above the lowest compatible published approach minimums, but not less than 600-2 for a precision

approach or 800-2 for a non-precision approach, and forecast to remain so for 1 hour after ETA at the alternate.

6.20. Destination Requirements (for filing purposes). The forecast destination weather will be according to AFI 11-202V3 and the following:

6.20.1. File two alternates when:

6.20.1.1. The forecast visibility (intermittent or prevailing) is less than published for an available DoD or National Aeronautical Charting Office (NACO) precision approach; or

6.20.1.2. The forecast ceiling or visibility (intermittent or prevailing) is less than published for all other approaches. For approaches with no published ceiling requirement (for example Jeppesen approaches), the minimum required ceiling shall be computed by taking the published HAA or HAT and rounding it up to the nearest one hundred feet (or as determined by MAJCOM TERPs review). For example, a Jeppesen VOR approach with a published HAA of 642 feet would require a forecasted ceiling of 700 feet.

6.20.1.3. The forecast surface winds (intermittent or prevailing) exceed limits corrected for RCR.

6.20.2. File an alternate, regardless of forecast weather, when the destination aerodrome is outside the 48 conterminous states. **EXCEPTION:** OCONUS, intra-theater flights that do not exceed 3-hours, comply with basic AFI 11-202V3.

6.20.3. When filing to a remote or island destination, aircrews will use 1+15 holding fuel (in lieu of an alternate and 45 minutes holding fuel). A remote or island destination is defined as any aerodrome which, due to its unique geographic location, offers no suitable alternate (civil or military) within 2 hours flying time. The forecast weather at the remote or island destination must meet the following criteria:

6.20.3.1. The prevailing surface winds, corrected for RCR, must be within limits at ETA and forecast to remain so for 2 hours thereafter, and

6.20.3.2. The prevailing ceiling and visibility must be equal to or greater than published minimums for an available non-precision approach [excluding Approach Surveillance Radar (ASR)], for ETA plus 2 hours. However, if a precision approach is available, the ceiling or visibility may be intermittently below non-precision approach minimums (excluding ASR), but not below precision approach minimums (for ETA plus 2 hours). **NOTE:** See chapter 17 of this AFI for fuel planning considerations for destination requirements.

6.21. Adverse Weather.

6.21.1. Turbulence. Flight into areas of forecast or reported severe turbulence is prohibited.

6.21.1.1. Crews should confirm the type of aircraft the forecast turbulence applies to, or what type of aircraft reported the encounter, to gain a more accurate picture for their route of flight. Turbulence category charts are found in Air Force Weather Agency technical note AFWA/TN 98/002, *Meteorological Techniques*.

6.21.1.2. The PIC is responsible for ensuring all passengers are seated, with seat belts fastened, when areas of moderate or greater turbulence are encountered or anticipated.

WARNING: Serious injury may occur if passengers do not have their seat belts fastened and the aircraft encounters moderate or severe turbulence.

6.21.1.3. Do not fly into an area of known or forecast moderate or greater mountain wave turbulence.

6.21.2. Icing. Flight into areas of forecast or reported severe icing is prohibited. Prolonged operation, such as cruise flight or holding, in areas of moderate icing should be avoided.

NOTE: Air Force Weather Agency technical note AFWA/TN 98/002, *Meteorological Techniques*, states that freezing drizzle is equivalent to moderate icing and freezing rain is equivalent to severe icing.

6.21.2.1. Do not takeoff under conditions of freezing rain. Do not takeoff under conditions of freezing drizzle except when the aircraft has been properly de-iced/anti-iced with approved commercial Type II/IV de-icing fluids IAW applicable FCM procedures. For additional information regarding USAF de-ice/anti-ice requirements and procedures, consult TO 42C-1-2.

6.21.2.2. Freezing precipitation, snow, freezing fog, or temperatures near 0°C, may cause ice or frost to accumulate on aircraft surfaces. When an aircraft requires de-icing/anti-icing prior to takeoff, refer to the following:

6.21.2.2.1. Aircrews will only use de-ice and anti-ice fluids listed in the FCM or approved by the aircraft manufacturer. Aircrews will be familiar with, and follow all restrictions in the FCM with respect to anti-ice/de-ice procedures and holdover times.

6.21.2.2.2. MIL-A-8243 Type I and Type II de-icing fluids do not provide any anti-icing benefit, and therefore do not have holdover times. As a guide, for approved anti-icing fluids, crews may use published anti-icing holdover times IAW TO 42C-1-2, *Anti-Icing, Deicing and Defrosting of Parked Acft*, and AFFSA holdover tables located at the AFFSA website. The holdover time begins when anti-icing fluid is first applied and the PIC shall use time, temperature, and dilution of mixture to determine when times are exceeded and re-apply fluid if required.

6.21.2.2.3. In all cases, PICs will ensure a visual inspection of the aircraft is completed within 5 minutes of departure. In addition to a visual inspection, a tactile inspection may be required within 5 minutes of departure per the aircraft FCM. The PIC will conduct a tactile inspection as necessary IAW the FCM.

6.21.2.3. C-20/C-37: Based on actual testing and review of the runoff characteristics in the undiluted (neat) form, Gulfstream has determined that Type IV de-icing fluid is aerodynamically acceptable for the wing. Consult the Gulfstream AOM/AFM and/or Gulfstream FSR for the most current list of approved Type IV fluids.

6.21.3. Thunderstorms. Do not fly directly above (within 2,000 feet) thunderstorms or cumulonimbus clouds. If unable to vertically clear thunderstorms or cumulonimbus clouds by at least 2,000 feet, avoid them by at least:

6.21.3.1. 20NM at or above flight level FL230.

6.21.3.2. 10NM below FL230. **CAUTION:** Aircraft damage may occur 20NM or more from any thunderstorms. Aircrews must familiarize themselves with information on thunderstorm development and hazard.

6.21.4. The use of ground-based radar as a means of thunderstorm avoidance should only be used to assist in departing an inadvertently penetrated area of significant weather. It should never be considered a normal avoidance procedure. When relying exclusively on ground-based radar for weather avoidance, and the ground controller is unable to provide avoidance instructions, attempt to maintain VMC by:

6.21.4.1. Changing routing.

6.21.4.2. Diverting to alternate.

6.21.4.3. Declaring an emergency and requesting priority assistance.

6.21.5. Aircrews should avoid flying in areas of recently dissipated thunderstorms and advected clouds (horizontal movement of clouds caused by wind) downwind of thunderstorms.

6.21.6. In order to minimize exposure to thunderstorm hazards when approaching or departing an airport in an area where thunderstorms are occurring or are forecast:

6.21.6.1. Attempt to maintain VMC.

6.21.6.2. Maintain at least 5NM separation from heavy rain showers.

6.21.6.3. Avoid areas of high lightning potential, i.e., clouds within plus or minus 5,000 feet of the freezing level or plus or minus 8°C of the freezing level. **NOTE:** Approaches or departures may be accomplished when thunderstorms are within 10NMs. The thunderstorms must not be producing any hazardous conditions (such as hail, lightning, strong winds, gusts fronts, heavy rain, wind shear, or microburst) at the airport, and must not be forecast or observed to be moving in the direction of the route of flight (to include the planned missed approach corridor, if applicable).

6.21.7. When performing approaches and landings at locations where temperatures are 0°C or below, refer to the FIH Section D, Temperature Correction Chart, to correct MDA, DH, and other altitudes inside the FAF.

6.21.8. In-flight Weather Advisories. Significant Meteorological Information (SIGMET) and other National Weather Service in-flight weather advisories are issued for large areas. Contact appropriate military weather facility or flight service station to determine mission applicability and impact.

6.21.9. Volcanic Dust Precautions. Aircraft flight operations in areas of forecast or known volcanic activity or dust is prohibited. Plan all missions to avoid volcanic activity by at least 20 NMs.

6.21.10. Lightning Avoidance. The following conditions are most favorable for lightning strikes and prolonged flight in them should be avoided:

6.21.10.1. Within 8°C of freezing.

6.21.10.2. In clouds or in any intensity of precipitation or turbulence associated with thunderstorms.

6.22. Standby/Alert Mission Pre-departure Procedures. Standby/Alert missions include any mission where the scheduled departure time is less than 12 hours after original notification. Procedures for standby/alert missions will vary depending on the type mission, type of aircraft

and time available between notification and departure. Procedures also vary depending on time of day (i.e., duty hours or non-duty hours). The following general procedures apply in most cases:

6.22.1. Normally the standby/alert PIC is notified of an standby/alert mission by current operations, SOC, or aircrew scheduler (USAFE/PACAF: AMD notifies unit). When notified, the following will be covered:

6.22.1.1. The mission number, departure spot, expected departure time, DV name and position, and number of passengers. If the mission is supporting another VIP Aircraft, you may be instructed to log mission symbol S-7, and if you are not given a mission number, use the mission call sign plus the static two or three digit suffix number, i.e. SAM 70, in place of the mission call sign plus the four digit mission number suffix.

6.22.1.2. The itinerary details which are available. You may be asked to confirm times, airports, preferred FBOs, etc.

6.22.1.3. Fuel load requirements.

6.22.1.4. Threat assessment, tactics and airfield security information as applicable.

6.22.1.5. Items you want briefed to your crewmembers during notification. You should specify aircrew uniform or civilian clothes.

6.22.2. FAs normally require cash for purchases. Reference local supplement.

6.22.2. **(MACDILLAFB)** Standby/Alert Mission Pre-departure Procedures. All 310 AS Flight Attendants (FA) have access to the In-Flight fund after coordinating food requirements with the flight chief or assistant flight chief. This fund is intended to provide 310 AS FAs with the funding required to pre-purchase meal supplies for missions prior to execution. Use of personal Government Travel Cards (GTC) is normally not authorized for pre-purchasing mission meal supplies.

6.22.3. For immediate launches overseas during duty hours, the SOC or aircrew scheduler will arrange for passports, shot records and navigation kits (as applicable) to be delivered to the aircraft. In addition, the SOC or aircrew scheduler will arrange an intelligence briefing and/or intelligence package pick-up. After duty hours, the PIC will designate who will pick up passports, shot records, navigation kits, intelligence package (as applicable) and confirm who will handle pre-launch paperwork. Normally, the duty scheduler (during duty hours), SOC or the CP/AMD (after duty hours) will order a weather briefing, intelligence briefing, and computer flight plans, if required. Current North Atlantic Track (NAT) messages are always available at the CP. For missions departing immediately, the duty scheduler (during duty hours) or the CP/AMD (after duty hours) will file a flight plan for the first mission leg. The crew must arrange desired dispatch/mission operations service for subsequent legs. The duty scheduler will assist in obtaining CFPs when requested. During duty hours, the SOC will coordinate with mission operations to prepare and dispatch diplomatic clearance and advance notice messages. After duty hours, the CP/AMD controller will arrange to handle messages. If you have adequate crew rest and notice prior to departure, you may accomplish pre-launch flight planning yourself.

6.22.4. The SOC and aircrew schedulers will notify the rest of the crewmembers. They will be briefed on the mission/aircraft numbers, departure time, where the aircraft is/will be

spotted, required fuel load, general itinerary and number of days away, and any items the PIC has designated for briefing.

6.22.5. Reporting.

6.22.5.1. PICs normally report to base operations/squadron/CP to pick up the dispatch flight plan, weather briefing and intelligence package, file a flight plan (if required), and then report to the aircraft. For immediate launches, one of the other pilots will normally report directly to the aircraft. For all other launches, one of the other pilots will normally pick up passports/shot records, crew orders, navigation kits, and intelligence packages (as applicable), then report to the aircraft for pre-launch preparation.

6.22.5.2. FEs/FCCs report directly to the aircraft to monitor fueling and reconfiguration, and accomplish preflight inspections. Keep the CP advised of any aircraft problems.

6.22.5.3. CSOs pick up applicable crypto kits and report to the aircraft for preflight. They act as the crew monitor and notify the CP and PICs if crewmembers do not report within a reasonable time.

6.22.5.4. FAs report to their duty section to pick up supplies. During duty hours, the duty scheduler will arrange for another FA to assist with commissary goods and aircraft preparation. Do not delay reporting for shopping. Aircraft preparation is the most important priority. Obtain cash advances from unit resource advisor (duty hours) or from the CP (non-duty hours). Order fleet service and report to the aircraft.

6.22.6. Immediate Launch Clearances. Pilots should ask clearance delivery for a full route clearance if the CP, IFM/CDS, SOC or aircrew scheduler files the flight plan.

6.23. Crew Station Times. Crewmembers will normally be at their duty stations with all checklists accomplished up to the point of engine start not later than 30 minutes prior to departure. Crewmembers will be prepared to depart as expeditiously as is safely possible if the DV arrives early.

6.24. Operational Risk Management (ORM). ORM is a logic based, common sense approach to making calculated decisions on human, material, and environmental factors before, during, and after all operations. USAF policy on ORM is contained in AFRD 90-9, *Operational Risk Management*. PICs will accomplish ORM worksheets IAW MAJCOM and local guidance as part of predeparture/preflight activities.

Section 6C—Preflight

6.25. AFTO 781, ARMS Aircrew/Mission Flight Data Document.

6.25.1. Review AFTO 781 series before applying power to the aircraft or operating aircraft systems. The exceptional release must be signed before flight. A maintenance officer, maintenance superintendent, or authorized civilian normally signs the exceptional release. If one of these individuals is not available, the PIC may sign the exceptional release. Ensure that the DD Form 1896, *DoD Fuel Identaplate*, and AIR card is aboard the aircraft.

6.25.2. One-Time Flights. An aircraft may be released for a one-time flight with a condition that might be hazardous for continued use, provided the aircraft is airworthy for one flight to another station. Refer to TO 00-20-1, *Aerospace Equipment Maintenance Inspection*,

Documentation, Policies, and Procedures, for downgrade authority and procedures. After the maintenance release is obtained, coordinate mission requirements with the controlling agency. The PIC's concurrence is required before the aircraft can be flown. Approval authority for one-time flights is contained in [paragraph 4.6](#).

6.25.3. For Red X clearing procedures at stations without maintenance support, refer to paragraphs 12.3. and/or 16.4. of this AFI.

6.26. En Route Aircraft Preflights. FEs, FCCs and CSOs will accomplish aircraft preflights following crew rest. If the ground time will exceed 72 hours or if the aircraft has been left unattended, aircrews should accomplish an aircraft inspection/walk-around of the aircraft within 24 hours of scheduled departure, when practical. Anytime en route maintenance has been performed, the affected systems will be pre-flighted and should be operationally checked as soon as possible if practical. Thru-flight inspections will be completed anytime a preflight is not required. FAs only need to accomplish a thru-flight inspection at en route stops. Pilots will ensure flight controls are checked IAW the FCM.

6.27. Aircrew Life Sustaining Equipment Requirements. The minimum quantity of oxygen aboard an aircraft before takeoff must be sufficient to accomplish the planned flight from the ETP to recovery, should oxygen be required.

6.27.1. C-37 Oxygen Waiver Policy. A waiver to AFI 11-202, Volume 3, Table 6.1, permitting C-37A/B aircraft to operate above FL410 without one pilot donning an oxygen mask is granted, under the following provisions:

6.27.1.1. Operations up to FL450 will be treated the same as those currently allowed in AFI11-202 Volume 3, Table 6.1, up to FL410. Crews will limit exposure to higher altitudes by planning all missions at or below FL410. Any missions planned at altitudes above FL410 (requesting waiver) require MAJCOM A3 approval. Coordinate through unit OG/CC and OGV for processing the request.

6.27.1.2. Should fuel reserves, adverse weather or turbulence necessitate a climb above FL410, C-37A/B crews may operate up to FL450 with oxygen immediately available to both pilots under the following restrictions:

6.27.1.2.1. Both pilots will occupy their duty positions.

6.27.1.2.2. The Emergency Descent Mode (EDM) must be functional.

6.27.1.2.3. The autopilot must be engaged and functional in each axis.

6.27.1.2.4. The auto-throttles must be engaged and functional.

6.27.1.2.5. Internal baggage door must remain closed.

6.27.1.2.6. Flights over terrain greater than 13,000 feet MSL require one pilot to be continually on oxygen if the aircraft is above FL410.

6.27.1.3. If all the above criteria cannot be met, one pilot will don an oxygen mask IAW AFI 11-202 Vol 3, Table 6.1. Additionally, if the cabin pressure low warning message illuminates at or above FL400, activating the EDM, the crew will take the following actions:

6.27.1.3.1. Crew Oxygen Masks - Don (All)

6.27.1.3.2. Speed Brakes - Extend (P or FE)

6.27.1.3.3. Emergency Descent Procedures - Initiate (PF)

6.28. Fleet Service. Ensure required fleet service items are aboard the aircraft early enough to permit inventory prior to engine start.

6.29. Crash Position Indicator (CPI) and Emergency Locator Transmitter (ELT). CPIs and ELTs must be operative for all flights except those remaining in the local area. If a CPI or ELT deploys or activates inadvertently, notify ATC immediately. In the case of a deployed CPI, if the aircraft is scheduled to fly a local or is en route with no replacement airfoil available and the airplane is permitted to continue the mission, a locally manufactured airfoil should be installed over the missing CPI.

6.30. Handling of Classified Cargo, Registered Mail, High-Visibility Aircraft Parts Shipments, and Courier Material.

6.30.1. These shipments are normally not carried on VIP passenger aircraft. PICs may accept or decline shipments at their discretion based on mission requirements or crew or aircraft capabilities. Receipts will be obtained for classified cargo, high-visibility aircraft parts shipments, signature services, and registered mail at the on-load and off-load station using the cargo manifest.

6.30.1.1. Defense Courier Service (DCS) couriers coordinating with the PIC are authorized to designate officer or enlisted, (E-5 and above) crewmembers on military aircraft as couriers to escort and safeguard courier material when other qualified personnel are not available. Qualified passengers, if carried, are designated before designating crewmembers. The following restrictions apply:

6.30.1.1.1. Primary crewmembers will not be designated without the consent of the PIC.

6.30.1.1.2. Crewmembers on aircraft scheduled to stop at locations where DCS couriers cannot provide en route support will not be designated as couriers. This does not relieve the PIC of the responsibility for life and death urgent shipments.

6.30.2. During stops at en route locations supported by DCS stations, DCS couriers are required to meet designated couriers to protect the material.

6.30.2.1. During unscheduled stops, crewmembers may place courier material in temporary custody of the following agencies listed in descending order of priority:

6.30.2.1.1. DCS courier

6.30.2.1.2. TOP SECRET control officer of the US armed forces

6.30.2.1.3. US Department of State diplomatic courier

6.30.2.1.4. US Department of State activity

6.30.2.1.5. US military guards

6.30.2.1.6. US DoD civilian guards

6.30.3. If unable to follow the itinerary to the destination of the courier material, or if material is lost, stolen, or otherwise compromised, report circumstances to the nearest

Defense Courier Station and notify the local US military commander or US government activity.

6.30.4. Life or death urgency shipments consist of biological or other medical supplies of such urgency that human life is dependent upon immediate receipt. Shipments will be manifested separately and the manifest annotated with the words LIFE OR DEATH URGENCY. All shipments will be handled on a hand-to-hand receipt basis, using either the air cargo manifest or the DD Form 1907, *Signature and Tally Record*, for unit moves. The PIC, or designated representative, will be briefed on the urgency of the shipment and be made the custodian during flight.

Section 6D—Departure

6.31. On Time Takeoffs. A delay is charged any time the DV and passengers are ready to move at the scheduled departure time and the aircraft is not ready for departure or cannot depart due to maintenance or operational reasons.

6.31.1. The simplest definition of a VIP delay is a failure to block out when the DV is ready at the scheduled time due to maintenance or operational reasons, thus delaying the DV. To promote the credibility of our reliability rate the following will be considered delays:

6.31.1.1. A delay is credited when the mission blocked out "on-time" but could not takeoff due to maintenance or operational reasons, thus delaying the DV.

6.31.1.2. A delay is credited when the mission blocked out "early" but could not takeoff due to maintenance or operational reasons, thus delaying the DV. The DV party should expect departure any time after stations time (30 minutes prior to scheduled takeoff time), or any time the crew has agreed (explicitly, or by loading the party, closing the door and implying readiness for departure) to depart early. If the party arrives prior to stations time and the crew is not ready a delay will not be charged. When the crew indicates they are ready (i.e. boarding party, closing door, removing stairs, starting engines, etc.), further delay would constitute a VIP delay.

6.31.1.3. A delay is credited when the mission blocked out and took off "on-time" but air aborted or diverted to an airport other than the next scheduled stop due to maintenance or operational reasons, thus delaying the DV.

6.31.2. Right side engine may be started prior to final on-load of all passengers, baggage, and gear in order to expedite overall engine start process. The PIC will ensure the right side of the aircraft is safe, clear and all right side aircraft baggage doors are closed/secure. The left side engine will not be started until all passengers, baggage and gear are on board, left-side aircraft baggage doors are closed/secured and the area around the aircraft is safe and clear.

6.32. Cabin Security Procedures for Takeoff and Landing. The following procedures should be followed prior to all takeoffs and landings:

6.32.1. The FA should assure all carry-on luggage, equipment and supplies are secured as soon as possible after boarding passengers. Ensure all passenger carry-on baggage is stowed to prevent a hazard during unforeseen events on takeoff or landing (i.e. aborted takeoff, emergency landing, low-level wind shear, turbulence, etc.). **EXCEPTION:** The primary DV

may use a portable laptop computer on the fixed table (stowable table for C-20/C-37) during taxi, takeoff, and landing. No other use of carry-on equipment or raised tables is permissible during take-off and/or landing as they pose an unacceptably high risk of blocking emergency exit routes. After considering extenuating circumstances (i.e. potential wind shear/turbulence, combat departure/arrival, aircraft malfunctions, etc.), the PIC may direct that all carry-on baggage be stowed to include the DV compartment. Notify the PIC when excessive carry-on baggage (topside) precludes safe stowage.

6.32.2. The 1st FA will coordinate with the PIC the anticipated taxi time prior to commencing any cabin service prior to takeoff.

6.32.3. The 1st FA should notify the cockpit crew that the cabin is secure prior to being seated for takeoff or landing. The cockpit crew should confirm the cabin security report prior to takeoff and landing. At the PICs discretion, if conditions warrant (i.e., immediate takeoff clearance), the pilots may alert the passengers and crew using the PA system.

Section 6E—En route

6.33. Flight Progress.

6.33.1. Prior to coast out fix, plot the oceanic portion of the flight on an appropriate Oceanic Plotting Chart (OPC). Annotate the chart with the mission number, PIC's name, preparer's name, and date. If practical, chart may be reused.

6.33.2. Anytime waypoint data is inserted into the FMC/FMS, it will be verified by two primary crewmembers. Check both the coordinate information and the distances between waypoints against the flight plan.

6.33.3. In-flight, use all available navigational aids to monitor FMC/FMS performance. Immediately report malfunctions or any loss of navigation capability which degrades centerline accuracy to the controlling ARTCC. Use the following procedures for flight progress:

6.33.3.1. Obtain a coast out fix prior to, or immediately on entering the CAT I Route or overwater EROPS segment. Perform a gross navigation error check/altimetry check using available NAVAIDs and annotate the position, altitude and time on the chart.

6.33.3.2. When approaching each waypoint, recheck coordinates for the next waypoint. Approximately 10 minutes after passing each oceanic waypoint, record and plot the aircraft position and time on the chart, and ensure compliance with courses and ETA tolerances.

6.33.3.3. If a revised clearance is received, record and plot the new route of flight on the chart. For CPDLC operations, maintain a log of ATC clearances and retain with the OPC.

6.33.3.4. Monitor FMC/FMS loaded EROPS ETP alternates for weather/NOTAMs. Contact dispatch or weather for updates if necessary.

6.33.4. Post Mission Papers. Upon return to home station, turn in the charts (copies if reused) and applicable computer flight plans to the squadron stan/eval function. Squadron

stan/eval will retain the charts, CFPs, CPDLC clearance logs, and associated materials for a minimum of 3 months.

6.33.5. Operations in International/National Territorial Airspace (See FLIP, FCG, AP, and MDS series instruction for further guidance). US military aircraft and DoD personnel entering another nation to conduct US government business therein must have the approval of the foreign government concerned to enter their airspace. Foreign clearances for US international air operations are obtained through the DAO. Refer to FLIP GP for discussion of international strait passage, archipelagic sea lane passage, procedures to follow if intercepted, and other international foreign sovereignty issues.

6.33.5.1. There are essentially two types of airspace: international airspace and national territorial airspace. International airspace includes all airspace seaward of coastal states' territorial seas. Military aircraft operate in such areas free of interference or control by the coastal state. National Territorial airspace, also referred to as territorial or sovereign airspace, includes airspace above territorial seas, archipelagic waters, inland waters, and land territory and is sovereign airspace. Overflight may be conducted in such areas only with the consent of the sovereign country.

6.33.5.2. IAW international law, the US recognizes territorial sea claims and the corresponding airspace up to 12 nautical miles measured from baselines drawn consistent with international law (normally the low-water mark). Diplomatic constraints and/or a lack of diplomatic clearances usually result in missions operating in international airspace. Because of this, it is imperative sufficient information be provided far enough in advance to allow compliance with FCG requirements established by the countries concerned. The US does not normally recognize territorial claims beyond 12 nautical miles; however, specific guidance from certain US authorities may establish limits, which differ from the standard.

6.33.5.3. Flight Information Region (FIR). An FIR is defined as an area of airspace within which flight information and related services are provided. An FIR does not reflect international borders or sovereign airspace. Aircraft may operate within an established FIR without approval of the adjacent controlling coastal state/country, provided the PIC avoids flight in sovereign airspace.

6.33.5.4. Aircrews on a flight plan route, which takes them from international airspace into national territorial airspace for which approved aircraft clearances were obtained, should not amend entry point(s).

6.33.5.5. Safe Passage violations of foreign sovereignty result from unauthorized or improper entry or departure of aircraft. Aircrews should not enter into territorial airspace (12 NM seaward from sovereign landmass) for which a clearance has not been duly requested and granted through diplomatic channels.

6.33.5.6. ATC agencies are not vested with authority to grant diplomatic clearances for penetration of sovereign airspace where prior clearance is required from the respective country. Aircraft diplomatic clearances are obtained through diplomatic channels only.

6.33.5.7. In the event air traffic control agencies challenge the validity of a flight routing or attempt to negate existing clearances, pilots must evaluate the circumstances. The normal response will be to attempt to advise the air traffic control agency that the aircraft

will continue to planned destination as cleared in international airspace. The key phrase is "in international airspace." Safety of flight is paramount in determining mission continuation. Under no circumstances should aircrews construe a clearance which routes their mission over sovereign airspace which was not approved through diplomatic channels prior to mission departure, as being valid authorization. If faced with this situation, aircrews must contact the appropriate MAJCOM C2, as soon as possible, to obtain the correct approvals.

6.33.5.8. Aircrews operating missions requiring unique or specially developed routing will normally be briefed at home station, onload station, and/or by the last C2 facility transited prior to performing the critical portion of the mission.

6.33.5.9. Aircrews normally are not tasked to and should not fly "due regard" routings unless coordinated with the appropriate MAJCOM C2 with mission execution authority and specifically directed in the mission FRAG. The "due regard" or "operational" option obligates the military PIC to be their own ATC agency to separate their aircraft from all other air traffic. If operational requirements dictate, PICs may exercise the "due regard" option to protect their aircraft. Aircraft will return to normal air traffic services as soon as practical.

6.33.6. SPINS. Prior to transiting AOR airspace, review specific theater guidance, including SPINS. At a minimum, review the AOR communication plan, special airspace, and airfield ingress and egress procedures. Ensure FMC/FMS waypoints for tactical reporting points, approaches, and departures are loaded. If appropriate, review combat entry and exit checklists with crew members and designate a time/point to initiate or complete the checklists.

6.34. Navigational Aid Capability. Refer to chapter 11 of this AFI.

6.35. Communications Instructions for Reporting Vital Intelligence Sightings (CIRVIS) and Other Reports. Report all vital intelligence sightings from aircraft as indicated in FLIP planning or FLIP En route Supplement.

6.35.1. In-Flight harassment or hostile action against aircraft. Aircraft subjected to harassment or hostile action by foreign aircraft will immediately contact the nearest USAF air and ground voice facility and report the encounter. Include aircraft nationality, type, insignia, or any other identifying features; note position, heading, time, speed when harassed, and the type of harassment. Request relay of the report to the nearest C2 center. Also attempt to contact the nearest CP when in UHF and VHF range.

6.35.2. Other incidents will be reported as indicated in AFI 10-206, *Operational Reporting*.

6.36. Communications.

6.36.1. HF Communications. Confine message traffic to essential operational matters. Perform an HF radio ground check prior to takeoff when the use of HF radio may be required for ATC or C2 communications. Establish HF contact before going out of UHF and VHF range. If unable to establish HF contact with the controlling HF station and an alternate means of relay of ATC information in oceanic areas is not available, return to the nearest suitable support base. ALE equipped aircraft should preflight in the ALE mode.

6.36.2. General. Provide ARTCC position and weather observations when required. If unable to contact an ATC agency, attempt relay through the GLOBAL HF stations. Frequencies for GLOBAL HF stations are listed in the FIH.

6.36.3. AF Form 72, *Air Report (AIREP)*. When directed by departing weather facility, take and record an AIREP at each position report over a CAT I Route. Identify inaccurate CFP winds by special report if the average wind for a route segment exceeds either 30 degrees error in wind direction or 25 knots in wind speed. Turn in completed AF Form 72 to the destination USAF weather facility.

6.36.4. SELCAL code assignments: Reference local supplement for unit tail numbers.

6.36.4. **(MACDILLAFB)** SELCAL code assignments. 10028 – FSBG; 10029 – HSKQ; 10030 – DSEH.

6.36.5. ATO and SPINS. Prior to transiting an AOR with SPINS and ATO requirements, load assigned IFF modes/codes. Additionally, contact and monitor appropriate C2 agencies at designated times and points along route of flight.

6.37. In-Flight Emergency Procedures. The PIC shall report deviations from directives that may occur as a result of an emergency according to AFI 11-202V3. Time and conditions permitting, inform passengers of the situation and intentions.

6.37.1. Notification of Controlling Agencies. When practical after completing the aircraft emergency action checklists and associated actions, crews should furnish the controlling agency and appropriate C2 center a description of the difficulty, assistance required, intentions, and any other pertinent information.

6.37.2. The PIC may initiate a CONFERENCE HOTEL/SKYHOOK when additional expertise is necessary. Communications procedures are as follow:

6.37.2.1. Local Area. When in UHF or VHF range, initiate the conference over appropriate frequencies.

6.37.2.2. En route. Attempt to establish a phone patch with the nearest or controlling C2 center using GLOBAL HF network, UHF/VHF stations, SATCOM, etc. If unable, aircrews are permitted to use ARINC radio service as an additional avenue for phone patch connectivity (ref [paragraph 6.37.2.4](#) of this AFI).

6.37.2.3. Provide the following information when time permits.

6.37.2.3.1. Narrative description of the situation to include actions taken by the crew and the intentions of the PIC.

6.37.2.3.2. Fuel on board and hours of endurance.

6.37.2.3.3. Position.

6.37.2.3.4. Altitude and flight conditions.

6.37.2.3.5. Number of personnel and DVs on board.

6.37.2.3.6. Qualification of PIC.

6.37.2.3.7. Planned landing base.

6.37.2.3.8. ETA at landing base.

6.37.2.4. ARINC phone patch. If unable to contact a station with phone patch capability, the USAF has a contract with ARINC to provide this capability. ARINC has VHF coverage over the CONUS and Caribbean regions and HF coverage over most of the Atlantic and Pacific regions. Contact procedures can be found in the IFM Aircrew Flimsy available on the TACC web site. It is recommended that this flimsy be placed in each mission kit. Additionally, ARINC is the oceanic position reporting service provider, and the position reporting frequencies found on enroute charts can be used to obtain phone patch frequencies from the radio operator.

6.38. Need for Medical Assistance. When a person aboard the aircraft requires medical care, the PIC will notify the station of intended landing in sufficient time so the aircraft may be met by medical personnel. Notification will include the patient's sex, approximate age, and major complaint.

6.39. Weather Forecasts.

6.39.1. PIC is responsible for obtaining destination weather prior to descent. The primary sources are TACC Global Mobility Weather Operations, Operational Weather Squadrons (OWS), USAF weather flights via pilot-to-meteorologist service (PMSV), MAJCOM approved CDS or FAA Flight Service Stations (FSS). Refer to the FIH for an OWS listing and their applicable AORs. The ATC system can provide weather information to en route aircraft.

6.40. Not Used.

Section 6F—Arrival

6.41. Descent. Prior to descent into unfamiliar areas, appropriate terrain charts [Operational Navigation Chart (ONC), Sectional Aeronautical Chart, Tactical Pilotage Chart (TPC), or Joint Operations Graphic (JOG)] should be reviewed to increase aircrew situational awareness of obstructions. Primary crewmembers will not be involved in duties other than aircraft operations, descent and approach monitoring, and required checklist items from the initial descent point to landing.

6.41.1. Night and Marginal Weather Operations. Fly a precision approach, if available, at night or during marginal weather. If a precision approach is not available, fly any available approved instrument approach.

6.41.1.1. During night VMC conditions, if an approved instrument approach is not available, a visual approach may be flown as long as crews review appropriate VFR terrain charts and the intended runway has outlined runway lighting and is clearly discernible IAW AFI 11-202V3 paragraph 5.9.5. However, VIP crews should back up the visual approach with visual glide slope indicator (VASI, PAPI etc.). Use of FMC/FMS solution [Lateral Navigation (LNAV)/VNAV] and/or Enhanced Vision System (EVS) is authorized in lieu of visual glide slope lighting.

6.41.1.2. On training and evaluation flights at familiar fields, pilots may perform VFR traffic patterns without (VASI, PAPI etc.). See local supplement for listing of familiar fields and local restrictions.

6.41.1.2. (MACDILLAFB) Familiar fields and local restrictions: See [Table 9.1](#) in this supplement.

6.41.1.3. For recovery at home station, pilots may elect to fly a visual or non-precision approach, if weather minimums permit.

6.41.2. Tactical Considerations. Prior to descending through a known or suspected WEZ, the PIC should review applicable AFTTP options with the crew. In addition, the PIC must comply with published AOR SPINS and airfield tactical arrival procedures.

6.42. Instrument Approach Procedures. DoD/National Geospatial-Intelligence Agency (NGA), NACO or MAJCOM approved FLIP procedure can be flown by USAF aircrews without requiring a TERPS review. Any non-DoD (Jeppesen, Host Nation) approach requires a TERPS review that can be requested through the appropriate MAJCOM TERPS office. **EXCEPTION:** Aircrew using the host government-sanctioned FLIP product for airfields located in a Special Accredited Host Nation do not require TERPS reviews.

6.42.1. Weather. Prior to starting an instrument approach or beginning an en route descent, pilots will confirm that existing weather is reported to be at or above required minimums for the lowest compatible approach. Pilots shall increase the published visibility minimums of an instrument approach by ½ SM or as noted in NOTAMs, on ATIS, or on the approach plate, when the runway approach lighting system (ALS) is inoperative. **NOTE:** This applies only to the ALS itself, not to VASIs, PAPIs, and other lights that are not a component of the ALS.

6.42.2. Precision Approach Minima. The ILS or Precision Approach Radar (PAR) decision height will provide a height above touchdown of 200 ft or higher. For CAT II ILS approaches, use the lowest published radar altitude. For PAR approaches, visibility will be no lower than RVR 2400 (730 meters) or 1/2 mile visibility (800 meters) with no RVR readout available.

6.42.3. Circling approach minimums will be as published for the applicable aircraft category. If not published by category, limit circling minimums to an MDA based on a HAA and visibility as indicated below or as published, whichever is higher.

6.42.3.1. Category C: 500 feet HAA, 1 1/2-half mile visibility.

6.42.3.2. Categories D and E: 600 feet HAA and 2-mile visibility.

6.42.4. NDB approaches. NDB approaches may be flown during day, night, or IMC after compliance with any airfield restrictions in GDSS and the ASRR (**NOTE:** some airfields will continue to be restricted IAW ASRR criteria for mountainous terrain, landing illusions, etc.). Back up each approach with available NAVAIDs/area navigation (RNAV)/GPS to include loading the NDB coordinates in the FMC/FMS (if equipped).

6.42.5. RNAV, GPS and RNAV(GPS) Instrument Departures, Arrival and Approaches. All VIP C-9, C-20, C-32, C-37, C-40 and VC-25 aircrews are authorized to fly pure GPS, RNAV, and RNAV(GPS) instrument departures, arrivals, day or night, IMC or VMC. Comply with procedures and temperature corrections IAW AFI 11-202V3 and FIH. Aircraft must have RNP as published on the IAP. The PM shall monitor lateral cross track, vertical velocity trends, IAW FCM guidance and report alerts [required navigation performance

(RNP), RAIM or loss of GPS signal] to the PF. PF shall execute missed approach if excessive deviations occur.

6.42.5.1. Equipment. Aircraft must have operable RNAV (INS/IRS) and/or GPS-updated FMC/FMS equipment to ensure sufficient RAIM, or appropriate level of actual navigation performance (ANP) is available IAW FCM procedures prior to initiating the approach. IAP notes such as “DME/DME RNP 0.3 N/A” or “GPS Required” state that GPS signal and aircraft equipment must be operational to start the approach. For aircraft where the MEL/MMEL does not allow the approach, or if the required approach RAIM/ANP is not available, the approach shall not be flown.

6.42.5.2. RNAV Instrument Approaches. All VIP Aircraft and certified aircrews are approved to perform RNAV approaches IAW AFI 11-202V3 and FCM guidance.

6.42.5.2.1. LNAV approaches. LNAV approaches are non-precision approaches and may be flown IMC to a barometric LNAV MDA(H). They may also be flown using VNAV procedures to a derived decision altitude (DDA) = LNAV MDA(H) +50ft. The PM shall monitor lateral track error IAW FCM guidance and provide trends to the PF.

6.42.5.2.2. VNAV approaches. VNAV procedures differ from LNAV procedures as they are similar to ILS procedures following vertical path guidance. VNAV approaches may be flown IMC to a VNAV DA(H). IAW FCM guidance, C-20H, C-32, C-37, and C-40 aircraft are authorized descent to published barometric VNAV DA (corrected for temp) in World Geodetic System 1984 (WGS-84) compliant airspace only. Use of remote altimeter settings to VNAV DA(H) minimums is prohibited. The PM shall monitor lateral/vertical track error IAW FCM guidance and provide trends for PF.

6.42.5.2.3. RNAV (RNP) approaches. Aircrews are not authorized to fly RNAV (RNP) approaches until aircraft equipment is certified, aircrews are trained, and AMC/A3 has issued operational approval. This does not affect the capability to fly RNAV, RNAV (GPS), GPS, or “OR GPS” approaches.

6.42.5.3. Overlay approaches. The GPS Approach Overlay Program is an authorization for pilots to use GPS avionics under IFR for flying designated nonprecision instrument approach procedures, except LOC, LDA, and simplified directional facility (SDF) procedures. These procedures are now identified by the name of the procedure and “or GPS” (e.g., VOR/DME or GPS RWY 15). Other previous types of overlays have either been converted to this format or replaced with stand-alone procedures. Only approaches contained in the current onboard navigation database are authorized.

6.42.5.4. WGS-84 compliance. Individual country compliance with the WGS-84 means that the country’s NAVAID and obstacle database conforms to the same US grid standard that today’s updated avionics use to determine position. US NAS/Canadian Domestic Airspace is WGS-84 compliant. WGS-84 compliance is one of several items which are monitored to determine if a country’s published RNAV(GPS) and overlay terminal procedures are authorized for use by USAF aircrews. PICs shall check www.jeppesen.com to determine compliance if a country’s WGS-84 status is in doubt. On the Jeppesen home page, type “WGS-84 Status Report” in the search field to access

the compliance list. Except as noted below, only those procedures that are WGS-84 compliant may be flown using FMC/FMS guidance.

6.42.6. Not Used.

6.42.7. C-37 A/B Approach to straight-in landing operations below DA, DH, or MDA using enhanced vision system (EVS). C-37A/B EVS is approved for use in day, night, or IMC IAW the applicable FAA-approved Gulfstream Airplane Flight Manual (AFM), Aircraft Operating Manual (AOM), and Quick Reference Handbook (QRH). Refer to the AFM, AOM, and QRH for operational procedures and limitations. For straight-in instrument approach procedures other than Category II or Category III, operating below the authorized MDA or continuing an approach below the authorized DH is not authorized unless:

6.42.7.1. A current and qualified EVS pilot, IAW AFI 11-2SAM-CSM-DVGV1, occupies the left seat;

6.42.7.2. The aircraft is continuously in a position from which a descent to a landing on the intended runway can be made at a normal rate of descent using normal maneuvers, and the descent rate will allow touchdown to occur within the touchdown zone of the runway of intended landing;

6.42.7.3. The pilot determines that the enhanced flight visibility observed by use of a certified enhanced flight vision system is not less than the visibility prescribed in the standard instrument approach procedure being used;

6.42.7.4. The following visual references for the intended runway are distinctly visible and identifiable to the pilot using the enhanced flight vision system:

6.42.7.4.1. The approach light system (if installed); or

6.42.7.4.2. The following visual references in both [paragraphs 6.42.7.4.2.1](#) and [6.42.7.4.2.2](#) of this section:

6.42.7.4.2.1. The runway threshold, identified by at least one of the following:

6.42.7.4.2.1.1. The beginning of the runway landing surface;

6.42.7.4.2.1.2. The threshold lights; or

6.42.7.4.2.1.3. The runway end identifier lights.

6.42.7.4.2.2. The touchdown zone, identified by at least one of the following:

6.42.7.4.2.2.1. The runway touchdown zone landing surface;

6.42.7.4.2.2.2. The touchdown zone lights;

6.42.7.4.2.2.3. The touchdown zone markings; or

6.42.7.4.2.2.4. The runway lights.

6.42.7.5. At 100 feet above the touchdown zone elevation of the runway of intended landing and below that altitude, the flight visibility must be sufficient for the following to be distinctly visible and identifiable to the pilot without reliance on the enhanced flight vision system to continue to a landing:

6.42.7.5.1. The lights or markings of the threshold; or

6.42.7.5.2. The lights or markings of the touchdown zone.

6.42.8. Missed Approach. Prior to starting any instrument approach, ensure proper sequencing of waypoints to the missed approach waypoint if lateral path is followed. Additionally, pilots will confirm their aircraft can accomplish the missed approach (to include holding) and meet or exceed all climb gradients specified in the missed approach procedure. If unable to meet required climb gradients, pilots must coordinate alternate missed approach procedures with ATC that will ensure terrain clearance, prior to commencing the approach. Do not initiate the approach if OEI performance will not permit safe obstacle clearance on the missed approach.

6.42.8.1. Not used.

6.42.8.2. Not used.

6.42.8.3. Weather below minimums: Pilots will not execute an approach if advised prior to starting the en route descent or penetration that the airfield is below landing minimums.

6.42.8.3.1. If a pilot starts the published approach, (an en route descent to an approach may be considered a published approach), and subsequently determines the weather is below minimums, the pilot must not deviate from the last ATC clearance until obtaining a new or amended clearance. The pilot may elect to:

6.42.8.3.2. Request clearance to a holding fix or alternate, as applicable.

6.42.8.3.3. Continue the approach as published to the missed approach point and land, if the aircraft is in a position to make a safe landing and the runway environment is in sight.

6.42.8.3.4. Established on a Segment of the Approach. If established on a segment of the approach or being radar vectored to final approach and the weather is reported or observed to be below approach minimums, the PIC has the option of continuing the approach to the MAP/DA/DH. If deciding to abandon the approach, level off (or descend if a lower altitude is required for the missed approach procedure). Comply with the last assigned clearance until a new or amended clearance is received.

6.42.8.3.5. Do not continue the approach below minimums unless the aircraft is in a position to make a safe landing and the runway environment is in sight.

6.42.8.3.6. If the approach is continued, PICs will ensure sufficient fuel is available to complete the approach and missed approach and proceed to a suitable alternate with normal fuel reserves.

6.42.8.3.7. CAT II/III approaches will not be continued if weather is reported below CAT II/III minimums.

6.42.8.3.8. The PIC has final responsibility for determining when the destination is below designated minimums and for initiating proper clearance requests.

6.42.9. CAT II/III Procedures. Special aircraft and aircrew training required. Refer to AFI 11-217V1, Chapter 19 and appropriate FCM for CAT II/III ILS information.

6.42.9.1. CAT II minimum RVR of 1200 ft (350 meters).

6.42.9.2. CAT II minimums based on a HAT no lower than 100 ft.

6.42.9.3. CAT II approaches without radio altimeter (RA) setting for DH are authorized. In this case IAP statement "RA NA" denotes irregular terrain changes that affect RA. Utilize barometric DH and inner marker if approved on the IAP. If inner marker is inoperative, CAT II approaches are not authorized.

6.42.9.4. CAT I ILS procedures will be used when unable to use alternate FCM guidance for local barometric DA(H) procedures.

6.42.9.5. CAT IIIA minimum RVR of 700 ft (200 meters).

6.42.9.6. CAT IIIB minimum RVR of 150 ft (50 meters).

6.42.9.7. Use Surface Movement Guidance and Control System (SMGCS) lighting (if available) at destination and taxi route.

6.42.10. Computed Microwave Landing System (MLS) Approaches. Aircrews will not fly computed MLS approaches unless authorized by the FCM.

6.43. Tactical Arrivals. If ingressing a WEZ and/or an airfield with known or suspected threats, review applicable AFTTPs and published airfield tactical arrival procedures with the crew.

6.44. Unscheduled Landings. Notify the airfield selected for an emergency diversion as soon as possible to allow maximum time to prepare the required assistance or services. ARTCC and C2 centers will assist the PIC as necessary in notifying the appropriate agencies.

6.44.1. Over-Flying Scheduled Refueling Stops. Before offering to over fly scheduled refueling stops, the PIC must consider all consequences that may arise. As a minimum, coordination with the contact, final arrival airport, over flight windows and greeting parties must be considered. Optimally the option of over-flying refueling stops should be coordinated with the contact and C2 through appropriate channels prior to departing home station.

6.45. Maintenance Debrief. Complete the AFTO 781, *ARMS Flight and Mission Data Report*, after each flight. After landing, crewmembers debrief maintenance personnel on the condition of the aircraft, engines, avionics equipment, and all installed special equipment as required. Crewmembers are also responsible for documenting cosmetic faults on the aircraft to ensure maintenance is aware of the flaw. See local maintenance debrief policies in local supplement of this AFI.

6.45. (MACDILLAFB) Maintenance Debrief. Maintenance debrief will take place at the aircraft with Gulfstream Aerospace Corporation (GAC) CLS personnel. The Aircraft Commander will ensure all applicable forms or suitable copies, in accordance with squadron procedures (i.e., AFTO 781, *ARMS Flight and Mission Data Report*, Comm. Surveys, etc.), are provided to CLS prior to departure from the aircraft.

6.46. Customs and Border Clearance.

6.46.1. Normal Operations:

6.46.1.1. The unit dispatching the mission is normally responsible for the border clearance of all aircraft.

6.46.1.2. When staff support is not available, border clearance is the responsibility of the PIC. Duties may be assigned to ground personnel or to other designated crewmembers, but the PIC retains ultimate responsibility. The PIC is responsible for ensuring the following:

6.46.1.2.1. Crew members and passengers possess current passports and valid visas, when required.

6.46.1.2.2. Crew members and passengers have current record of immunization.

6.46.1.2.3. Cargo entry documents are in proper order.

6.46.1.2.4. Departing or entering the US through an airport where border clearance can be obtained.

6.46.1.2.5. Obtaining border clearance for aircraft cargo, passengers, crew and baggage, if required, before takeoff to a foreign area or after arrival from a foreign area.

6.46.1.2.6. Spraying the aircraft (FCG and [paragraph 6.47](#) of this AFI).

6.46.2. Procedures for US Entry:

6.46.2.1. En route, the FA or designated crewmember will distribute personal customs declarations to all passengers and crew members. The FA or designated crewmember will also brief passengers and crew members on customs regulations, and prepare and compile necessary border clearance forms for the FA's signature.

6.46.2.2. En route, notify the C2 agency or airfield contact at the base of intended landing of any change in ETA to ensure that border clearance is accomplished as soon as possible after landing.

6.46.2.3. Obtain a permit to proceed when military necessities require that an aircraft (which has landed in the United States for customs clearance) proceed to another location in the US to obtain border clearance. The permit to proceed delays customs inspection of cargo, passengers, and crew until arrival at the off-load station and saves intermediate off-loading and reloading normally required for customs inspection. The permit to proceed is valid only to the airport of next landing where the border clearance must be completed or a new permit to proceed issued by a customs official. Do not make intermediate stops between the issue point of the permit to proceed and destination of manifested cargo unless required by an emergency situation or directed by the controlling C2 center.

6.46.2.4. When an aircraft lands for a US border clearance, a US Customs representative normally will meet the aircraft to obtain the required documents. Do not deplane passengers or crew members unless necessary for safety or the preservation of life and property. Do not unload until approved by customs and agriculture personnel or their designated representatives. This procedure applies to the initial landing in the US and all landings required when operating on a permit to proceed or until all crew, passengers, and cargo complete final border clearance.

6.46.2.4. **(MACDILLAFB)** Some DoD installations have personnel, known as Military Customs Inspectors – Excepted (MCI-E), who are authorized to conduct customs

inspections. MCI-Es are only authorized to inspect active duty military personnel. Ensure U.S. Customs representatives are available when carrying civilian personnel.

6.46.3. Inspections of US aircraft by foreign officials:

6.46.3.1. Follow USAF policy on status of military aircraft as stated in the FCG, chapter 6, section G. In substance, this policy holds that US military aircraft are immune from searches, seizures, and inspections (including customs and safety inspections) by foreign officials. In addition, PICs must be aware of and adhere to any specific FCG provisions for individual countries.

6.46.3.2. If confronted with a search request by foreign authorities, aircrews should use the following procedures:

6.46.3.2.1. In most cases, search attempts may be halted simply by a statement of the PIC to the foreign official that the aircraft is a sovereign instrumentality not subject to search without consent of USAF headquarters or the US Department of State officials in the country concerned. This should be clearly conveyed in a polite manner so as not to offend foreign authorities who may honestly, but mistakenly, believe they have authority to search USAF aircraft.

6.46.3.2.2. If foreign authorities insist on conducting a search, the PIC should make every effort to delay the search until he or she can contact USAF headquarters or the appropriate embassy officials. The PIC should then notify these agencies of the foreign request by the most expeditious means available and follow their instructions.

6.46.3.2.3. If foreign officials refuse to desist in their search request, pending notification to USAF headquarters or the appropriate embassy, the PIC should indicate that he or she would prefer to fly the aircraft elsewhere (provided fuel, flying time, and mechanical considerations permit a safe flight) and request permission to do so.

6.46.3.2.4. If permission is refused and the foreign authorities insist on forcing their way on board an aircraft, the PIC should state that he protests the course of action being pursued and that he intends to notify both USAF headquarters and the appropriate American embassy of the foreign action. The PIC should not attempt physical resistance, and should thereafter report the incident to USAF headquarters and appropriate embassy as soon as possible. The PIC should escort foreign authorities if the inspection cannot be avoided.

6.46.3.3. Other procedures may apply when carrying sensitive cargo or equipment. Follow these procedures and applicable portions of classified FCG.

6.47. Insect and Pest Control.

6.47.1. Responsibility. PIC will ensure required spraying is accomplished according to AFJI 48-104, *Quarantine Regulations of the Armed Forces*, FCG, or as directed by higher headquarters. Certify the spraying on Customs Form (CF) 7507, or on forms provided by the country transited. Aircraft should never be sprayed with passengers on-board. The only exception is when the FCG mandates it.

6.47.1.1. When spraying is required, use insecticide, aerosol d-phenothrin-2 percent, National Stock Number (NSN) 6840-01-067-6674 (or equivalent), to spray the aircraft. Use the following guidelines:

6.47.1.1.1. Direct the nozzle toward the ceiling of the compartment or space being sprayed.

6.47.1.1.2. Spray spaces inaccessible from within the aircraft after completely loading fuel, baggage, cargo, and passengers, including baggage compartments, wheel wells, and other similar spaces.

6.47.1.1.3. Spray the cabin, cockpit, and other spaces accessible from within the aircraft after the crew is aboard and after closing all doors, windows, hatches, and ventilation openings. **CAUTION:** If the insecticide label directs disembarkation after use, spray prior to boarding crew or passengers. Close all doors and hatches for 10 minutes after dispensing and ventilate for 15 minutes before allowing anyone on board.

6.47.1.2. Spraying Times. Spray the aircraft for the following times unless longer periods are specified for the country being transited:

Table 6.2. Spray Times.

MDS Aircraft	C-20/C-37	C-9	C-32	C-40	VC-25
Spraying Time	15 Sec	37 Sec	65 Sec	45 Sec	118 Sec

6.47.2. Responsibility of PIC In-flight. When seeing any insect or rodent infestation of the aircraft in-flight, notify the destination C2 center, base operations, or airport manager of the situation before landing so the proper authorities can meet the aircraft.

6.47.3. Procedure at Aerial Port of Disembarkation (APOD). On arrival at an APOD, do not open cargo doors or hatches except to enplane officials required to inspect the aircraft for insect or rodent infestation or to deplane the minimum number of crewmembers required for block-in duties. Do not on-load or off-load cargo or passengers until the inspection is satisfactorily completed. This procedure may be altered to satisfy mission or local requirements, as arranged by the base air terminal manager or the local C2 organization.

Section 6G—Miscellaneous

6.48. Dropped Object Response. If a dropped object is discovered, the flight crew will:

6.48.1. Notify the Current Operations or SOC and the controlling agency as soon as practical; includes routing, altitude, weather, etc.

6.48.2. Notify unit safety and maintenance at the next station transited.

6.49. Cockpit Voice Recorder (CVR) and Flight Data Recorder (FDR). If involved in a mishap or incident, after landing and terminating the emergency, open the CVR and FDR power circuit breakers.

6.49.1. FDR and CVR systems, if installed, should be operative prior to departure and operated continuously from the start of the takeoff roll until the aircraft has completed

landing roll at destination. If en route failure occurs, continue the mission to a station where adequate repairs can be made. If involved in a mishap or incident, open the CVR and FDR power circuit breaker after landing and after terminating the emergency. CVR recordings are considered factual and the transcript is not a privileged document. The actual aircrew voices on the tape should be considered protected under the Privacy Act. See AFI 91-204, *Safety Investigations and Reports*.

6.50. Life Support and Dash 21 Equipment Documentation. The PIC or designated representative will:

6.50.1. Prior to departing home station or en route stations, ensure appropriate serviceable protective clothing, life support, survival, and dash 21 equipment for the entire or remainder of the mission are aboard the aircraft. Review applicable leased aircraft procedures.

6.50.2. Prior to departing home station and following en route crew changes, review AF Form 4076, *Aircraft Dash 21 Equipment Inventory*, to ensure all required dash 21 equipment has been certified as installed by maintenance, the initial check has been signed by maintenance, and configuration documents match mission requirements.

6.50.3. Prior to departing home station and following en route crew changes, review, sign, and date the AFTO 46, *Pre-positioned Life Support Equipment*, to ensure all required protective clothing and life support and survival equipment have been certified as installed by aircrew life support and that configuration documents match mission requirements. Ensure appropriate number and type of life preservers are aboard for over-water missions carrying children and infants.

6.50.4. Missing Equipment. Aircrew members discovering equipment missing will accomplish the following:

6.50.4.1. Make an AFTO 781 entry for equipment found missing. Additionally, ensure equipment removed from the aircraft at an en route station is documented in the AFTO 781.

6.50.4.2. Annotate AF 4076 and AFTO 46 in the next vacant column, by indicating the quantity remaining for the item. Ensure the ICAO location designator is entered above the check number of that column.

6.50.4.3. Leave AF 4076 and AFTO 46 on board the aircraft in the event of an en route crew change.

6.50.4.4. Advise the PIC and determine whether the missing equipment should be recovered or replaced before mission continuation.

6.50.4.5. Assist, as required, in preparing reports of survey for missing equipment.

6.50.4.6. When possible, advise MAJCOM Stan/Eval (or airport management) before mission continuation.

6.50.5. Additional Equipment. If more equipment is discovered during the preflight than is annotated on the AF 4076 and AFTO 46, annotate the total quantity in the next vacant column for the item. Ensure the ICAO location designator is entered above the check number of that column.

6.51. Passenger Restrictions. The only passengers on missions transporting DVs will be those of the official party and those space available passengers authorized by the on-board contact officer.

6.51.1. Space Available Passengers. For other than revenue and White House missions, PICs are authorized to release space available seats on mission legs when no official passengers are aboard (positioning and de-positioning legs). PICs are encouraged to release maximum space available seats subject to the following restrictions:

6.51.1.1. Revenue Missions. These are missions for which the using agency (typically a government agency other than DoD) is reimbursing DoD for use of the aircraft. Space available passengers on revenue missions must be approved in advance by USAF/CVAM/AMD/JOSAC (as appropriate) and the using agency contact officer through unit C2 agencies. This is essential to ensure proper funding and reimbursement. Consult CVAM/AMD/JOSAC to determine mission revenue status if in doubt. Congressional Delegations (CODEL) are not revenue missions.

6.51.1.2. White House Support Missions. Space available passengers will generally not be permitted aboard White House support mission aircraft without express permission of HQ USAF/CVAM. This is normally due to the security status of the aircraft, which may include positioning and de-positioning legs. When it is necessary to move aircrew members or support personnel on White House support mission aircraft, the WHMO will be advised and permission obtained through the unit C2 and CVAM. On de-positioning legs space available passengers will usually be permitted if the aircraft is no longer required to maintain an upgraded security status.

6.51.1.3. Billing. Space available passengers on revenue missions may be subject to being billed commercial first-class airfare by the using agency for the applicable route, depending on that agency's policy. If the DV or on-board contact officer releases seats, aircraft commander must ensure that any additional financial liability for the passengers is specified by the using agency on-board contact officer. PIC will ensure passengers understand and agree to any reimbursement conditions prior to boarding.

6.51.1.4. Anti-hijacking Inspections. Board space available passengers only after anti-hijacking inspections are completed. If a space available seat release is anticipated at an en route station, the local passenger service facility will be advised of the inspection requirement. Procedures for anti-hijacking inspections by the aircrew at stations without a military passenger service facility are specified in chapter 13. The PIC has final authority for accepting space available passengers.

6.51.2. Passenger Boarding. On all missions operating without security guards, the first FA will ensure that all passengers are listed on the passenger manifest prior to boarding the aircraft. **EXCEPTION:** The flight engineer will be responsible for greeting and checking passengers on the C-20/C-37. Passengers will be greeted and checked at the bottom of the steps. The PIC or the mission escort officer must clear any passengers not listed on the manifest prior to entering the aircraft. This task will be completed at the beginning of each mission and any time passengers have to re-board the aircraft.

6.52. Airfield Data Reports. Aircrews transiting strange airfields or airfields where conditions may adversely affect subsequent flight will:

6.52.1. Report airfield characteristics that produce illusions, such as runway length, width, slope, and lighting, as compared to standard runways, sloping approach terrain, runway contrast against surrounding terrain, haze, glare, etc.

6.52.2. Debrief the next C2 center transited.

6.53. Impoundment of Aircraft. If an aircraft is involved in a serious in-flight or ground incident, the PIC should impound the aircraft immediately after landing and contact the controlling C2 center and parent MAJCOM safety office for further instructions.

6.54. No Show Passenger Baggage. Unclaimed passenger baggage and untagged baggage will be subject to search and seizure. Under no circumstances will it be allowed on the aircraft. Tagged but no-show passenger baggage or baggage of passengers removed from flight will be downloaded prior to departure. Aircrew will not accept unaccompanied baggage except IAW AMCI 24-101.

6.55. Wake Turbulence Avoidance. Comply with wake turbulence avoidance criteria. Acceptance of traffic information, instructions to follow an aircraft, or a visual approach clearance is acknowledgment that the PIC will ensure takeoff and landing intervals and accepts responsibility of providing wake turbulence separation. Refer to FLIP GP section 6 for more information concerning wake turbulence separation.

6.56. Operations at Airports Above 10,000' MSL. Use approved FCM procedures and the following aircrew procedures for operations at airports above 10,000' MSL:

6.56.1. Raise cabin altitude to 10,000 feet during the descent. Configure aircraft pressurization, air conditioning, and oxygen/warning systems as required and complete the remaining depressurization on final approach.

6.56.2. A specific timed period of oxygen use prior to landing is not required. Aircrew members use oxygen during descent, approach, landing, takeoff, and ground operations when engines are running/checklist operations in progress.

6.56.3. PIC briefing and passenger briefings must include cautions on high altitude operations and hypoxia. All passengers are susceptible to hypoxia during depressurized flight above 10,000 feet cabin altitude. Take your time during ground operations at high altitude. Monitor and back up other crewmembers servicing or loading the aircraft. Keep portable oxygen bottles readily available in the event of over-exertion or hypoxia. Administer oxygen to any passenger displaying hypoxia symptoms.

6.56.4. Emergency Egress Restrictions. **CAUTION:** Do not, repeat, do not land pressurized.

6.57. Classified Equipment and Material.

6.57.1. Equipment. When classified equipment is onboard, ensure aircraft security requirements are met according to chapter 7 of this AFI. At bases not under jurisdiction of the USAF, ensure the aircraft and equipment are protected. AFI 31-401, *Information Security Program Management*, provides specific guidance concerning the security of various levels of classified equipment aboard aircraft.

6.57.2. Material. Ensure COMSEC and other classified materials are turned in at destination and receipts are obtained for COMSEC and classified material. The on-site C2 center will

provide temporary storage for COMSEC and other classified materials during en route, turnaround, and crew rest stops. If a storage facility is not available, the aircraft gun storage box or classified safe may be used for material classified up to and including SECRET. Encrypted COMSEC will only be transferred to authorized DoD personnel.

6.57.3. IFF/Selective Identification Feature (SIF). Ground check IFF/SIF prior to takeoff (ground test assets permitting). IFF self-test or radar interrogation will satisfy this requirement. This check is not required on stopover flights if the IFF is operational upon landing unless required by theater directives.

6.57.4. Mode 4. Aircrews will ensure that they have an operable Mode 4 when required for mission accomplishment. Aircrews will conduct an operational ground test of the Mode 4 (ground test assets permitting) prior to deployment overseas, or as specified in the OPOD or contingency/exercise tasking.

6.57.4.1. Attempt to fix an inoperable Mode 4 prior to takeoff. Do not delay takeoff or cancel a mission for an inoperable Mode 4, except when the aircraft will transit an area where safe passage procedures are implemented.

6.57.4.2. Conduct an inflight check of the Mode 4 on all missions departing the CONUS for overseas locations. Aircrews can request the Mode 4 interrogation check through NORAD on UHF frequency 364.2.

6.57.4.3. Aircraft with inoperable Mode 4 will continue to their intended destinations. Repairs will be accomplished at the first destination where equipment, parts, and maintenance technicians are available. In theaters where safe passage is implemented, aircraft will follow procedures for inoperable Mode 4 as directed in the applicable airspace control order or ATO.

6.57.4.4. Ground and inflight checks of the Mode 4, when conducted, are a mandatory maintenance debrief items. Crews will annotate successful and unsuccessful interrogation of the Mode 4 on all aircraft forms (AFTO 781A).

6.57.4.5. Aircrews will carry COMSEC equipment and documents required to operate the Mode 4 on missions when required for mission accomplishment. Prior to departing for any destination without COMSEC storage facilities, crews will contact their local COMSEC managers for guidance.

Chapter 7

AIRCRAFT SECURITY

7.1. General. Your mission places you and your aircraft in an environment highly vulnerable to security threats. The importance of the DVs transported and the high frequency of missions into civil airports throughout the world magnify this vulnerability. Positive security measures are required at all times. This chapter provides guidance on aircraft security and preventing and resisting aircraft piracy (hijacking) of VIP Aircraft. AFI 13-207, AFI 31-101, *The Air Force Installation Security Program (FOUO)*, and specific MAJCOM security publications contain additional guidance. Aircrews will not release information concerning hijacking attempts or identify armed aircrew members or missions to the public.

7.2. Security. The OG/CC or above may direct the use of security personnel above and beyond the requirements of AFI 31-101. The waiver approval authority for VIP RAVEN team composition, security and RAVEN team support requirements is the WG/CC exercising authority over VIP Aircraft.

7.2.1. Protection Level (PL)-1. Presidential WHMO, Office of the Secretary of Defense (OSD) designated aircraft are required continuous security protection at home station, en route operating locations and contract maintenance facilities. Units will define RAVEN requirements for PL-1 missions in local supp to this AFI.

7.2.1. **(MACDILLAFB)** Protection Level (PL)-1. Aircraft commanders will comply with security requirements as directed by the Mission Assessment Group (MAG). When conditions warrant security coordination not addressed elsewhere by appropriate authority, aircraft commanders will obtain appropriate guidance via the 310 AS/SOC or 310 AS/DO. Comply with requirements of AFI 31-101, *The Air Force Installation Security Program*.

7.2.2. PL-2/PL-3. When not designated as PL-1 aircraft, C-32 aircraft will be designated PL-2 resources. All other VIP Aircraft will be designated PL-3 resources. See AFI 31-104 for PL-2/PL-3 security requirements. Units will define RAVEN requirements for PL-2/PL-3 missions in local supp to this AFI.

7.2.2. **(MACDILLAFB)** PL-2/PL-3. See [paragraph 7.2.1](#) above

7.3. Air Force Installation Security Program. The following security procedures will implement AFI 31-101 requirements for VIP Aircraft:

7.3.1. PIC Authority. The PIC will ensure that adequate aircraft security measures are provided at all times.

7.3.2. Advance Security Support Arrangements. The PIC will ensure security support has been coordinated at en route stations in advance. If security requirements cannot be met prior to departure, the airfield may be deemed unsuitable for RON by the unit. Units may use ORM teams and Mission Assessment Groups (MAG) to integrate MAJCOM and AOR Intel/Threat Working Group (TWG) recommendations to determine suitability. OG/CC or equivalent is arbiter for security. Home station CP and unit C2 will assist the PIC for alert missions or en route diversions.

7.3.2.1. **(Added-MACDILLAFB)** If a full time security guard is required, and the aircraft commander or local defense/air attaché is unable to arrange for guards due to extenuating circumstances, the aircraft commander will contact the 310 AS/SOC or 310 AS/DO for guidance. The 310 AS/DO will coordinate with 6 OG/CC to determine the action to be taken.

7.3.3. Briefings. When required, PICs will obtain threat assessment and security capability evaluation briefings before departing home station. Unit C2 will provide the PIC with pertinent updates en route.

7.3.4. Baggage Security. Baggage not certified safe for loading by a responsible government agency will be inspected prior to loading at the PIC's discretion. Verify baggage identification against passenger manifest. Aircrew members will secure their own baggage. The PIC is responsible for explaining baggage security requirements to the mission contact.

7.3.4.1. On PL-1 and PL-2 aircraft, all passenger baggage will be inspected prior to loading. A RAVEN will verify baggage identification against the passenger manifest.

7.3.5. Fuel Security.

7.3.5.1. Fuel for PL-1 Presidential Aircraft must pass a laboratory analysis and be secured until used. The USAF advance agent will obtain and secure this fuel.

7.3.5.2. Fuel for other aircraft do not require secured fuel. Use fuel obtained from large capacity, high use sources not pre-designated for VIP Aircraft.

7.3.6. Flight Line Photography. There are no restrictions on exterior photography of VIP Aircraft. Interior photography is also allowed with the exception of the VC-25 and enroute aircraft. Interior photos of the VC-25 must be coordinated with WHMO through the PAG/CC. Interior photos of enroute VIP Aircraft are at the discretion of the PIC and the principle DV. Care must be taken to remove all classified materials from sight prior to authorizing any photography. Specific airfields may have restrictions regarding the photography of aircraft.

7.4. Not Used.

7.5. En Route Security.

7.5.1. Aircraft Access Control. Positive control of access to VIP Aircraft is mandatory.

7.5.1.1. RAVENs control access, after coordination with the PIC, to Presidential, Presidential Support, and certain other VIP Missions and will accompany these aircraft during the missions. When directed by the OG/CC, ASNCOs control access to VIP Aircraft. They will positively identify all individuals granted unescorted entry to the aircraft.

7.5.1.2. When RAVENs do not accompany aircraft, the aircrew is responsible for controlling access. At USAF installations, a passenger service representative normally assists in boarding passengers. The passenger service representative should be at the aircraft prior to passenger arrival and remain at the aircraft until loading is complete. Monitor all servicing and support personnel. Do not allow unidentified personnel onboard or around the aircraft. Escort unofficial visitors on board the aircraft and keep them under surveillance until they depart.

7.5.2. Use of Aircraft Sealing Devices. Except for Presidential, Presidential Support, and SDSAM aircraft protected by a RAVEN, VIP Aircraft should be sealed (at the discretion of the PIC) during all RONs and during any ground time when aircrew is absent from the aircraft. Seal doors and hatches according to local wing directives. Aircraft with an onboard ground security system meet the intent of this paragraph.

7.5.3. Refer to chapter 15 of this AFI for specific RAVEN procedures.

7.5.4. RAVEN policy. Typical teams will consist of a minimum of two USAF security force members depending on MDS and MAJCOM security requirements. The team travels as MEPs and are responsible to the PIC at all times. In turn, PICs are responsible for their welfare (transportation, lodging, etc.). PICs will ensure security team members receive a mission briefing and aircraft egress/passenger briefing (as appropriate).

7.5.4. **(MACDILLAFB)** RAVEN Policy. When RAVEN support is required, the 310 AS/SOC contacts the Phoenix RAVEN NCOIC during mission setup to confirm itinerary times and coordinate RAVEN requirements.

7.5.5. **(Added-MACDILLAFB)** Secure Launch. Secure Launch countries are identified by the AMC Threat Working Group, and will be briefed to crews prior to departure by 6 OG/OGI or designated representative from the tasking authority. They include countries with a high terrorism level, an environment for rapid disintegration of stability, and an extremely poor security environment.

7.5.5.1. **(Added-MACDILLAFB)** Secure Launch Procedures. Used for all COCOM support missions into Secure Launch countries (detailed procedures/information in AMCI 11-208, *Tanker/Airlift Operations*, [paragraph 2.3](#)).

7.5.5.1.1. **(Added-MACDILLAFB)** Six hours prior to a Secure Launch departure, the MacDill Command Post will contact the Tanker Airlift Control Center (TACC) Senior Controller for the current status of the secure launch airfield.

7.5.5.1.2. **(Added-MACDILLAFB)** If operations are normal, this information will be passed to the aircrew when they check-in, 1 to 2 hours prior to departure.

7.5.5.1.3. **(Added-MACDILLAFB)** If the TACC Senior Controller reports a change in status, the MacDill Command Post will notify the 6 OG/ CC to determine if the mission can move as scheduled.

7.5.5.1.4. **(Added-MACDILLAFB)** The final go/no-go determination will be made by the 6 AMW/CC in consultation with the 6 OG/CC, AMC Threat Working Group, and the aircraft commander.

7.6. Detecting Unauthorized Entry.

7.6.1. Suspected Unauthorized Entry. If the PIC suspects the aircraft has been tampered with or subjected to unauthorized entry, take the following actions:

7.6.1.1. Notify the local security authorities and request a thorough inspection of the aircraft for sabotage, explosive devices, and pilferage.

7.6.1.2. Notify CP and C2 centers. Advise them of any requirements for assistance, and give them your estimate of a revised departure time.

7.6.1.3. If there are indications that sabotage is a definite possibility or if security inspections may delay the DV party, notify the mission contact officer. Establish suitable departure time and if necessary, coordinate suitable alternate transportation through current operations or SOC.

7.6.1.4. Monitor the security check of the aircraft. When cleared by security authorities, conduct a thorough preflight inspection. Look for broken wiring, damaged components, foreign devices, etc.

7.6.1.5. If both the security authorities and the PIC are assured aircraft is safe to fly, notify the OG/CC. Depart only with the OG/CC approval. **EXCEPTION:** Presidential missions may depart with PAG/CC approval. Safety and aircraft security take priority over minimizing DV inconvenience.

7.6.2. Security awareness is crucial to effective mission accomplishment. Aircrews must always remain vigilant to their surroundings, especially at high threat, low security locations. During preflight activities, aircrews will inspect all accessible areas, to include aircraft wheel wells, and cargo compartments for personnel or other unfamiliar devices. Report any suspicious items to host security forces. Aircrews will maintain a heightened security posture throughout all pre-takeoff activities.

7.7. Preventing and Resisting Hijacking.

7.7.1. General Hijacking Guidance. A hijacking could create a serious international incident and jeopardize the safety of passengers and crew. High level DVs traveling aboard VIP Aircraft increase potential severity of any hijacking incident. Expect the National Military Command Center (NMCC) to become involved in resolving hijack crises. Military C2 is central POC if a hijacking threatens your VIP Aircraft or passengers at any location. The PIC is the coordinating authority for anti-hijacking procedures. The PIC has first-hand knowledge of the situation and must take every opportunity to keep command authorities apprised of the situation. Use military C2 channels to contact NMCC, who in turn will relay instructions to the PIC.

7.7.2. The Air Transportation Act of 1974 and the Federal Aviation Act of 1958, as amended, vest the FAA Administrator with exclusive responsibility for the direction of law enforcement activity in aircraft hijacking situations involving all aircraft (civil and military) in-flight in the United States.

7.7.3. In taking action during an aircraft hijacking situation, military forces will act under military command within the scope of their duties.

7.7.4. In the event an aircraft involved in an aircraft hijacking situation is carrying documents, equipment, or material that the DoD has determined to be highly sensitive, the DoD will provide the FAA, and where appropriate, the FBI, with all pertinent information. Where possible, the FAA will consult and cooperate with DoD prior to directing any law enforcement activity.

7.7.5. An aircraft is most vulnerable to hijacking when the aircrew is aboard and the aircraft is operationally ready for flight.

7.7.6. A concerted effort must be made to prevent the hijacking of military or military contract aircraft by detecting potential hijackers before they board the aircraft.

7.7.7. Should preventive efforts fail, any actual attempt to hijack a military aircraft must be resisted in a manner appropriate to the situation. Resistance may vary from dissuasion to direct confrontation, including the use of weapons. RAVENs are authorized to use weapons to subdue a hijacker.

7.7.8. Since air piracy may be committed by political terrorists or by individuals to whom the threat of death is not a deterrent but a stimulus, ordinary law enforcement procedures may be ineffective. Thus, successful conclusion of a hijacking situation and apprehension of the hijackers may require use of specialized law enforcement techniques and procedures.

7.7.9. Delaying actions have been most successful in overcoming hijackings without loss of life or property.

7.7.10. In the case of an aircraft carrying passengers, the primary concern is the safety of the passengers.

7.7.11. Assistance to hijacked civil or military contract aircraft will be rendered as requested by the PIC of the aircraft and the authority exercising OPCON of the anti-hijacking effort.

7.8. Preventive Measures. Commanders at all levels must ensure preventive measures are taken to minimize access to the aircraft by potential hijackers. When VIP Aircraft are operating away from home station, the PIC will ensure provisions of this chapter and AFI 13-207, as supplemented, are complied with.

7.8.1. Preventive measures include the following:

7.8.1.1. The host station passenger processing or manifesting facility should conduct anti-hijacking inspections.

7.8.1.2. Do not board passengers until the PIC is fully satisfied with inspection results.

7.8.1.3. In the absence of qualified passenger service representatives, the PIC will ensure the anti-hijacking inspection of passengers and baggage is accomplished.

7.8.2. Medical facility commanders are responsible for anti-hijacking inspection of patients. When patients are delivered to the aircraft by civilian sources, the aircrew will perform required inspections prior to loading.

7.8.3. During exercises or contingencies in support of combat operations involving the movement of large groups of personnel, the unit being supported should manifest passengers and perform anti-hijacking inspections.

7.8.4. Passengers will not carry weapons or ammunition on their person or in hand-carried baggage aboard an aircraft. **EXCEPTION:** Special agents, guards of the Secret Service or State Department, Personal Security Details and other individuals specifically authorized to carry weapons.

7.8.5. If weapons must be cleared, ask the individual to:

7.8.5.1. Move to a safe, clear area at least 50 feet from any aircraft, equipment, or personnel before unholstering or unslinging their weapons.

7.8.5.2. Clear weapons IAW standard safety procedures.

7.9. Initial Response. When an act of air piracy involves an Air Force installation or aircraft within the United States, response will be according to the following guidelines until such time as FAA assumes active direction of anti-hijacking efforts. Resist all attempts to hijack a military aircraft. Resistance may vary from simple discussion through deception and subterfuge, to direct physical confrontation, including the prudent use of weapons.

7.9.1. To counter a hijacking, actual or threatened, delay movement of the aircraft to provide time for ground personnel and the aircrew to establish communication and execute coordinated resistance actions.

7.10. In-Flight Resistance. After airborne, success in thwarting a hijacking depends on the resourcefulness of the aircrew. Many variables of a hijacking preclude use of any specific counter-hijacking procedure. Some key factors should be evaluated before deciding a course of action to be taken, including the nature of the threat, danger to life or crippling damage to the aircraft in-flight, destination indicated by the hijacker, and the presence of sensitive material onboard. Some counter-hijacking actions the aircrew may consider are:

7.10.1. Engage the hijackers in conversation to calm him or her and to evaluate what course of action might be effective.

7.10.2. Dissuade the hijacker.

7.10.3. Use facts or subterfuge to convince the hijacker intermediate stops are necessary.

7.10.4. Propose more favorable alternatives, such as landing in a neutral, rather than a hostile, country.

7.10.5. Exploit any reasonable opportunity to incapacitate or overcome the hijacker physically, including the prudent use of firearms.

7.10.6. Never give up control of the aircraft to a hijacker.

7.11. Communications Between Aircrew and Ground Agencies. Crews facing a hijacking threat will notify ground agencies by any means available as soon as practical and follow-up with situation reports as circumstances permit. Detailed guidance is contained in AFI 13-207.

7.11.1. Crews will transmit an in-the-clear notification of hijacking to ATC. If an in-the-clear transmission is not possible, set transponder to 7500. If unable to set the transponder, or if not under radar control, transmit a radio message indicating transponder change to 7500.

7.11.2. Aircrews will not use the covert signals depicted in AFI 13-207 Table 2, Covert Signals, to communicate the presence of a hijacking situation. Code words, covert notification actions, and further transponder changes will not be used.

7.12. Forced Penetration of Unfriendly Airspace. These procedures are designed to deter possible hostile action against the hijacked aircraft that has been forced to penetrate airspace of a nation unfriendly to the United States.

7.12.1. If instructions from the unfriendly nation are received either by radio contact or by air intercept before boundary crossing, comply with instructions received.

7.12.2. If no contact with unfriendly nation is made before approaching a boundary:

7.12.2.1. Maintain TAS not more than 400 knots.

7.12.2.2. Maintain an altitude between 10,000 and 25,000 feet if possible.

7.12.2.3. Fly a direct course toward destination announced by the hijacker, if no course is specified.

7.12.2.4. Transmit the international distress signal, MAYDAY, on any of the international distress frequencies (121.5 MHz, 243.0 MHz, or 2182 KHz) in an effort to establish communications.

7.12.2.5. Set Mode 3 code 7700 on transponder.

7.12.2.6. If radio contact cannot be established, follow procedures set forth in FLIP.

7.12.3. Consider the presence of classified documents and equipment aboard the aircraft. When a landing in an unfriendly nation is imminent, attempt to dispose of or destroy the equipment or material.

7.13. Arming of Crewmembers. Aircrews will be armed on all overseas missions unless RAVENs are a part of the crew (not required for a CONUS depot input for OCONUS units). Units will establish which crewmembers will be armed in their supplement to this AFI. All crewmembers should know who is armed. Arm aircrews on CONUS missions only when directed by the current operations or SOC IAW OPORD or OPLAN. Unit commanders will ensure that crewmembers are trained in weapon issue, loading, safety, firing, transfer, and receipt procedures. Comply with AFI 31-207, *Arming and Use of Force by Air Force Personnel*. If an armed crewmember must leave the crew en route, transfer the weapon to another authorized crewmember using AF Form 1297, *Temporary Issue Receipt*.

7.13. (MACDILLAFB) Arming of Crewmembers. Due to their extremely limited duties outside of the aircraft and to meet the intent of subsequent [paragraph 7.13.3](#), CSOs will be the primary crew member to arm on OCONUS missions. 310 AS/ CC has been delegated waiver authority for this policy and may make further adjustments through clarification in the 310 AS Standard Operating Procedures or 310 AS Operating Instruction 30-1, *Squadron Policies*.

7.13.1. Standby/Alert Launches. Do not delay the mission to pick-up weapons. If it appears there will be an unacceptable wait to get weapons, proceed to the aircraft and notify the CP.

7.13.2. Crew Rest. When crew must RON, secure weapons in the aircraft gun box with approved lock. Do not use local armories.

7.13.3. Wearing of Weapons. Wear weapons in holster, concealed at all times to prevent identifying armed crewmembers. Do not wear weapons off the flight line except to and from the C2 center, armories and other facilities associated with aircrew activities. When OCONUS, wearing weapons outside the aircraft is discouraged. Keep armed crewmembers inside the aircraft.

7.13.4. Weapons Storage In-flight. Crewmembers will be armed before preflight, onload, or offload duties and until completion of all offload duties. When no passengers are onboard, weapons may be stored in the gun box in-flight after a satisfactory stowaway check. Crewmembers will rearm before landing. Weapons need not be unloaded before placing them in a gun box.

7.13.5. Crewmembers will ensure they are reissued the same weapon until mission termination at home station.

7.13.6. Loading and Transfer of Weapons. Load and unload weapons at approved clearing barrels if available. Do not use a hand-to-hand transfer of loaded weapons to another crewmember; place the weapon on a flat surface.

7.14. Force Protection. Crews must be alert to the possibility of terrorist activities at all times. Reference AFMAN 10-100, *Airman's Manual*; Joint Service Guide 5260, *Service Member's Personal Protection Guide: A Self-Help Handbook to Combating Terrorism*; AFI 10-245, *Antiterrorism*; and applicable AFTTPs for Force Protection measures. The following considerations may help crewmembers avoid becoming victims of terrorism when operating OCONUS:

7.14.1. Personal Conduct. Crews must realize their conduct can make them a target for individuals dissatisfied with US foreign involvement in their national affairs. Local foreign nationals may or may not condone a military presence - crew conduct will be watched and judged. Therefore, utilize the following:

7.14.1.1. Maintain good military bearing both on and off duty.

7.14.1.2. Avoid dressing in clothes that highlight the fact you are an American, i.e. cowboy hats, wide belt buckles, shirts with pro-American slogans, etc.

7.14.1.3. Do not wear clothing displaying profanity.

7.14.1.4. Know where "off limits" areas are and avoid them.

7.14.1.5. When possible, travel in groups of two or more.

7.14.1.6. Avoid demonstrations for any cause.

7.14.1.7. Avoid discussion of politics.

7.14.1.8. Avoid using ranks or titles in public places.

7.14.2. Ground transportation security. When traveling to and from billeting, messing facilities, etc. consider the following to minimize drawing attention to yourself as a potential target:

7.14.2.1. If possible, consider not using a car that announces government ownership.

7.14.2.2. Park in well-lighted areas.

7.14.2.3. Always lock your car. If possible, do not leave it on the street overnight.

7.14.2.4. Avoid isolated roads and dark alleys.

7.14.3. Personal Identification. Consider the following actions to avoid advertising the fact you are an American:

7.14.3.1. Avoid military style luggage such as B-4 bags and duffel bags with military logos, etc. Luggage tags should be nondescript and not reflect the type of mission (e.g. no souvenir luggage tags from previous VIP Missions). All bags, including hand-carried bags, will have luggage tags.

7.14.3.2. Consider placing your official passport and related documents such as military ID, flight orders, dog tags in your hand-carried luggage and not in your wallet or purse.

7.14.3.3. Wear conservative styled civilian clothing when using commercial transportation.

7.14.4. Hotel Security. When billeted in commercial hotels, crews need to be aware of the following:

7.14.4.1. If possible, obtain rooms between the second and sixth floors.

7.14.4.2. Always lock interior locks when occupying rooms.

7.14.4.3. Always assume your room is monitored and avoid viewing or discussing classified material.

7.14.4.4. Sanitized crew lists with names only should be used to record room numbers.

7.14.4.5. At no time should the crew orders be given to hotel registration clerks.

7.14.4.6. Orders, itineraries, or other mission related materials should not be left in clear view in hotel rooms.

7.14.4.7. Avoid home station addresses on hotel registrations and baggage tags.

7.15. Protecting Classified Material on Aircraft. The PIC is responsible for protection of classified materials aboard their aircraft. The CSO, if available, is responsible for supporting the PIC with these duties. See requirements in AFI 31-401. As a minimum, ensure the IFF equipment is set to zero before leaving the aircraft.

Chapter 8

OPERATIONAL REPORTS AND FORMS

8.1. General. Applicable reports and forms are contained in this chapter.

8.2. AF Form 457, USAF Hazard Report. See AFI 91-202, *The US Air Force Mishap Prevention Program*.

8.2.1. The Air Force hazard reporting system provides a means for Air Force personnel to alert supervisors and commanders to hazardous conditions requiring prompt corrective action.

8.2.2. Special Procedures for Hazard Reports Concerning Weather. Complete the front of an AF Form 457 and address it to the parent wing flying safety office. If a computer flight plan deficiency is involved, attach one copy of the AF Form 72, *Air Report (AIREP)* or AF Form 4053, *INS Flight Plan and Log*, and the CFP to the report. Send the report so that the parent wing flying safety office receives it within 5 days.

8.3. AF Form 651, Hazardous Air Traffic Report (HATR). The AF Form 651 is a tool to report near midair collisions and alleged hazardous air traffic conditions. See Attachment 3 of AFI 91-202 for more information concerning the HATR program.

8.3.1. AFI 91-204, and AFMAN 91-223, *Aviation Safety Investigations and Reports*, list HATR reportable incidents.

8.3.2. The PIC shall report the hazardous condition to the nearest ATC agency (e.g. ARTCC, FSS, control tower, or aeronautical radio station) as quickly as safety allows. Include the following information in the radio call (as appropriate):

8.3.2.1. Aircraft identification or call sign.

8.3.2.2. Time and place (radial/DME of NAVAID, position relative to the airfield, incident, etc).

8.3.2.3. Altitude or flight level.

8.3.2.4. Description of the other aircraft or vehicle.

8.3.2.5. Advise controlling ATC agency that the PIC will file a HATR upon landing.

8.3.3. Deadline to file a HATR is 24 hours after event via any communication mode available. If landing airport has a USAF airfield management function, submit completed AF Form 651 to the airfield management officer for forwarding to the wing safety office. If landing airport does not have an airfield management office, notify the safety office of the Air Force base nearest to location where the condition occurred, PIC's home base safety office, or as prescribed by overseas MAJCOM. In that case, provide contact sufficient information to prepare AF Form 651.

8.4. AMC Form 97, AMC In-Flight Emergency and Unusual Occurrence Worksheet (AMC and AMC Gained Only). The AMC Form 97 is a tool to notify appropriate authorities of any mishap involving crewmembers or aircraft. PICs shall complete all appropriate areas of the form in as much detail as possible. When notified, AMC C2 agents will inform their supervisor/commander to start investigation and reporting activities IAW AFI 91-204, and

Operations Report 3 (OPREP-3) procedures. In addition, PICs will preserve all mission and flight related documents, (e.g. flight plans, weather briefings, NOTAMs, Weight and Balance form, etc.) for collection by appropriate safety officials.

8.4.1. PICs will report crewmember or passenger injury, aircraft damage, or injury/damage to another organization's people or equipment caused by PIC's aircraft/crewmember. At a minimum, report the following:

8.4.1.1. Any physiological episode (physiological reaction, near accident, or hazard in-flight due to medical or physiological reasons). **NOTE:** Crewmembers and passengers involved in a physiological episode will see a flight surgeon to be evaluated and to ensure the incident is reported in the Air Force Safety Automated System (AFSAS) as soon as practical.

8.4.1.2. A human factor related situation, [e.g. misinterpretation of instruments; information overload (i.e. tactile, aural, and visual input too fast to permit reasonable analysis/decision); aircrew task saturation (i.e. too many responses/actions required in a short period of time); or confused switchology (i.e. adjacent switches where actuation of wrong switch creates dangerous situation)]. Anonymous reports are acceptable.

8.4.1.3. A condition that required engine shutdown, in-flight flameout, engine failure, suspected engine power loss, or loss of thrust that required descent below MEA. Engine failures include, but are not limited to, shrapnel from a failed internal engine component penetrating the engine case, engine case rupture/burn-through, engine nacelle fire, substantial fuel leak, or unselected thrust reversal. Consistent with safety, immediately report incidents that involve multiple engines (may report single-engine incidents upon landing). **NOTE:** Exclude intentional shutdowns for training and/or FCF unless the engine fails to restart.

8.4.1.4. A flight control malfunction (including the autopilot and trim systems) that results in an unexpected or hazardous change of flight attitude, altitude, or heading. Enter the flag words, "Reportable Flight Control Malfunction" in the AFTO 781A.

8.4.1.5. A landing gear malfunction aggravated by failed emergency system or procedures.

8.4.1.6. An in-flight loss of all pitot-static or gyro-stabilized attitude/directional instrument indications.

8.4.1.7. Any spillage/leakage of radioactive, toxic, corrosive, or flammable material from aircraft stores or cargo.

8.4.1.8. Conditions that required pilot to depart takeoff or landing surface.

8.4.1.9. All in-flight fires regardless of damage.

8.4.1.10. All bird/wildlife strikes regardless of damage.

8.4.1.11. Incidents that, in the PIC's judgment, are in the interest of flight safety.

8.4.2. Always provide your home station safety officer a copy of relevant information. Make every effort to preserve all mission and flight related documents, such as flight plans, weather briefings, NOTAMs, Weight and Balance form, etc., for collection by appropriate

safety officials. PICs shall use the following precedence to report mishaps (as soon as feasible after event):

- 8.4.2.1. MAJCOM flight safety officer (FSO).
- 8.4.2.2. Any FSO.
- 8.4.2.3. The nearest USAF C2 center.
- 8.4.2.4. Any USAF Airfield Management Operations.

8.5. Report Violations, Unusual Events, or Circumstances. PICs shall document events that require them to deviate from AFI 11-202V3 (unless waived by competent authority) or alleged navigation errors (include over-water position errors over 24NMs, border, or ATC violations). Do not release names or personal aircrew information to non-USAF agencies.

8.5.1. Describe deviation(s) using the following report format:

- 8.5.1.1. Facts. Report pertinent details of the event.
- 8.5.1.2. Investigation and analysis. Report circumstances which required/drove deviation(s).
- 8.5.1.3. Findings and conclusions.
- 8.5.1.4. Recommendations to prevent recurrence.
- 8.5.1.5. Corrective actions taken.

8.5.2. Include the following attachments with the report:

- 8.5.2.1. Formal notification of incident.
- 8.5.2.2. Approved crew orders.
- 8.5.2.3. Crewmembers' official statements (if applicable).
- 8.5.2.4. Other pertinent documents submitted in evidence (logs, charts, etc.).

8.5.3. In addition to above (when aircraft is equipped), PIC shall download original flight plan to a floppy disk and turn it in to the C2 center or parent standardization and evaluation office.

8.5.4. OG/CC shall send the original investigation report to the parent MAJCOM within 45 days of the event/notification. AFRC OG/CCs shall send original investigation report through channels to HQ AFRC/IGI within 35 days of the event/notification. HQ AFRC/IGI will send the investigation report to HQ AFRC within 45 days of event/notification.

8.5.5. Use OPREP-3 reporting procedures contained in AFI 10-206, *Operational Reporting*, for navigation errors over 24 NMs.

- 8.5.5.1. When notified of a navigation position error, the PIC (or agency that receives initial notification) shall document the circumstances surrounding the incident (using report format below) and ensure C2 agents submit an OPREP-3.
- 8.5.5.2. Include the following information in the report:
- 8.5.5.3. The name and location of agency/unit submitting report.

8.5.5.4. Affected mission identification number.

8.5.5.5. Reference OPREPs-3 to determine type of event (i.e., state "navigation position error.").

8.5.5.6. The date, time (Zulu), and location (e.g., ARTCC area) of alleged infraction.

8.5.5.7. Describe facts and circumstances. Include aircraft type and tail number, unit (aircrew's wing or squadron), home base, route of flight, point of alleged deviation, and miles off course.

8.5.6. PICs shall expeditiously report unusual events/circumstances that impact their mission to appropriate MAJCOM agencies. Reportable events include, but are not limited to, spectrum interference, uncoordinated aircraft interception, fuel dumping, multiple engine failure, hostile fire, injury to passenger or aircrew member, hostile attacks on aircraft communications networks, etc. This list is not all exhaustive. Most events require C2 agents to forward OPREP reports to higher headquarters. In all cases, pass the "who, what, when, where, why, and how" of the incident to a C2 agency.

8.5.6.1. The Spectrum Interference Resolution Program, covered in AFI 10-707, *Spectrum Interference Resolution Program*, establishes procedures to combat the effect of meaconing, intrusion, jamming, and interference. PICs who encounter EMI will report the event to the nearest C2 agency as soon as practical.

8.5.6.1.1. Address EMI reports to: HQ AMC SCOTT AFB IL//A6O// and addressees listed in AFI 10-707. Send reports via electronic message format with the following information in plain text:

8.5.6.1.1.1. Frequency selected when EMI occurred.

8.5.6.1.1.2. Equipment affected by EMI. Location of the system. The system function, name, nomenclature, manufacturer with model number or other system description. The operating mode of the system, if applicable (frequency agile, pulse doppler, search, etc.).

8.5.6.1.1.3. Description of EMI (noise, pulsed, continuous, intermittent, on so forth).

8.5.6.1.1.4. Effect EMI had on system performance (reduced range, false targets, reduced intelligibility, data errors, etc.).

8.5.6.1.1.5. Date(s) and time(s) of EMI.

8.5.6.1.1.6. Location where EMI occurred (coordinates or line of bearing, if known, otherwise state as unknown).

8.5.6.1.1.7. Source of the EMI if known.

8.5.6.1.1.8. List other units that received interference (if known) and their location or distance and bearing from your location.

8.5.6.1.1.9. A clear, concise narrative summary on what you know about the EMI, with any actions taken to resolve the problem.

8.5.6.1.1.10. Whether or not PIC wants expert/technical assistance (include level

of security clearance expert requires).

8.5.6.1.1.11. Specify impact the EMI had on your mission.

8.5.6.1.1.12. Provide a POC (Name, Rank, DSN/Commercial Phone Number, and Duty hours).

8.5.6.1.2. C2 agents must prepare an OPREP-3 if EMI is suspected meaconing, intrusion, or jamming, interference sufficient to cause a hazard, or if, in the PIC's judgment, the situation warrants such a report.

8.5.6.1.3. PICs shall serve as classification authority for EMI reports. Evaluate an adversaries' ability to exploit certain systems using EMI and protect information accordingly. PICs on a non-sensitive mission or who judge the EMI to be interference from a non-hostile source need not classify EMI reports unless that report would reveal system vulnerability. Classify interference report(s) at stations located in combat areas or during sensitive military missions.

8.5.6.2. On aircraft that dial into the GNOC, CSOs must report hostile attacks on aircraft networks to the GNOC, where protective measures will be implemented and reported. Hostile attacks may include penetration attempts, denial of service, viruses, or malicious code. This is not an all-inclusive list.

8.6. Petroleum, Oil and Lubricants (POL) - Aviation Fuels Documentation. This section prescribes aviation POL (AVPOL) procedures that ensure correct documentation, form and invoice processing, and program supervision (reference DESC-I-31, *Purchase of Aviation Fuel and Services at Commercial Locations*). Use the Multi Service Corporation (MSC) AIR card for the purchase of aviation fuel and ancillary ground services at commercial airports (and some military installations) worldwide. The AIR card is authorized for use by all U.S. government aircraft, state, and local law enforcement aircraft, and some foreign government aircraft. All PICs should plan to use the "platinum" MSC card. In most cases, there will be no changes when refueling at non-Defense Energy Support Center (DESC) contract locations. The MSC card is accepted at approximately 4,800 locations worldwide. A list of all MSC-accepting merchants can be found at <https://www.airseacard.com>. It replaces the Standard Form (SF) 44, *Purchase Order-Invoice-Voucher*, at locations that accept the MSC card. MSC can be contacted 24 hours a day, 7 days a week regarding acceptance or refueling issues. Their toll free number is 1-866-308-3811.

8.6.1. Responsibilities. Aircrew and maintenance personnel will be familiar with AVPOL procedures and documentation requirements of this chapter. Improper use of the MSC card could create financial liability for the purchaser.

8.6.2. Refuel/defuel USAF aircraft at DoD locations whenever possible. If DoD service is not available, purchase fuel from other source(s) in the following priority:

8.6.2.1. Defense Fuel Supply Center (DFSC) or Canadian into-plane contracts.

8.6.2.2. Foreign government air forces. **NOTE:** DoD FLIP en route supplements identify locations with into-plane contracts.

8.6.3. AVPOL Forms Documentation and Procedures.

8.6.3.1. The DD Form 1898, *Fuel Sale Slip*, is the fuel transaction receipt used for purchases at other DoD locations, including DFSC into-plane contract locations. Log and place the DD Form 1898 inside the AF Form 664, *Aircraft Fuels Documenting Log*. The PIC or designated representative shall complete this form. **NOTE:** If the contractor insists on a unique invoice along with the DD Form 1898, annotate the vendor's invoice with "DUPLICATE DD Form 1898 ACCOMPLISHED."

8.6.3.2. The AF Form 664, *Aircraft Fuels Documenting Log*, is a tool to log and store all AVPOL transaction forms. Record all off-station transactions on the front of the form and insert the original form inside the envelope. Turn in the AF Form 664, with supporting forms, to maintenance debriefing or as directed by local procedures. The PIC or designated representative shall complete this form when appropriate.

8.6.3.3. The SF 44 may be used to purchase fuel, ground services and/or other authorized products when no MSC card contract is in place.

8.6.3.3.1. SF 44 fuel purchases where FBO agrees to invoice DESC for payment.

8.6.3.3.1.1. The aircrew shall present the SF 44 as the purchase invoice when an FBO refuses to accept the MSC card. The aircrew shall complete the SF 44 and attach it to the FBO vendor ticket/invoice when the FBO also declines use of the SF 44 and uses its own invoice/receipt. Fuel purchases shall be documented on a separate SF 44 from ground services and other authorized products since the FBO must invoice DESC for the fuel and the customer for non-fuel product and services.

8.6.3.3.1.2. Copies 1 and 2 of the SF 44 shall be provided to the FBO. Copy 1 of the SF 44 and one copy of the FBO commercial invoice, if applicable, shall be forwarded to the following address by the FBO to bill/invoice DESC: DESC-RRF, Building 1621-K, 2261 Hughes Avenue, Suite 128, Lackland AFB, Texas 78236.

8.6.3.3.1.3. Copy 3 of the SF 44 and one copy of the FBO commercial invoice, if applicable, shall be provided to the aircrew. Log and place a copy inside the AF Form 664. Aircrews shall present all fuel purchase receipts to the designated aviation squadron Certifying Official and/or Accountable Official upon return to home station to enable timely validation and financial obligation processing into the Fuels Automated System.

8.6.3.3.2. SF 44 fuel purchases where the FBO requires cash payment.

8.6.3.3.2.1. Cash fuel purchases are only authorized when either the FCG, requires cash payment, or when FBO locations outside the United States and U. S. Territories refuse MSC card and/or SF 44 invoicing processes. Aircrews required to pay cash for aviation fuel purchases shall employ the following procedures (**NOTE:** these procedures do not apply to non-fuel products or services):

8.6.3.3.2.1.1. The aircrew shall obtain cash from a local DoD Finance source that is charged to an approved Treasury suspense account prior to home station departure.

8.6.3.3.2.1.2. Aircrews shall complete the SF 44 and obtain the FBO fuel

vendor annotation in block 11 of the SF 44 to confirm total cash amount and also sign and date the SF 44 blocks 20 and 21. Log and place a copy inside the AF Form 664. Aircrew shall return unused cash to their local DoD Finance source upon return to home station. Present the completed SF 44 (for non-fuel charges only) to the appropriate home station administrative personnel for processing (e.g., Wing Refueling Document Control Officer, Finance Office, etc.)

8.6.3.3.3. SF 44 purchases of ground services and other approved products (not fuel).

8.6.3.3.3.1. Complete a separate SF 44 for non-fuel purchases. Provide the FBO copies 1 and 2 of the SF 44. The FBO shall use copy 1 and one copy of the FBO commercial invoice, if applicable, to directly bill/invoice the purchasing organization. Block 9 of the SF 44 shall reflect the organization name and address of the finance office responsible for payment to the FBO. The purchasing organization shall make payment to the FBO upon receipt of the invoice from the FBO. Log and place a copy inside the AF Form 664.

8.6.3.3.4. If the vendor presents their own form for signature and accepts the SF 44, write the statement "SF 44 Executed" on the vendor's form.

8.6.3.3.5. Turn in two copies of the SF 44 to the operations officer at home station.

8.6.3.3.6. Present the aircraft identaplate for purchases at SITCO Agreement locations. Make certain the invoice includes date of transaction, grade of product, quantity issued/defueled, unit of measure, and signature of USAF member who accepted product. If vendor also requires completed SF 44 write statement, "AF FORMS EXECUTED" on vendor's invoice. Log and place a copy inside the AF Form 664.

8.6.3.4. Purchasing Aviation Fuel in Canada. The DoD and Canadian Department of National Defense have signed a memorandum of understanding allowing DoD aircraft to use the DD Form 1896 when refueling at Canadian airfields with a Canadian National Defense Contract (CNDC). Use the AIR card for fuel purchases at Canadian airports without a CNDC, and for ground handling services at all Canadian airports.

8.6.3.5. Host Nation Forms. Use host country forms to effect purchases at foreign military airfields, including "replacement-in-kind" locations. Hand scribe information from aircraft identaplate on the local form. Log and place a copy inside the AF Form 664.

8.6.3.6. AF Form 1994, *Fuel Issue/Defuel Document*, records fuel purchases at USAF bases using a valid DD Form 1896. The PIC or designated representative shall complete the form then log and place a copy inside the AF Form 664.

8.6.3.7. AFTO 781H, *Aerospace Vehicle Flight Status and Maintenance Document*, records POL actions for particular airframe IAW applicable directives. The PIC or designated representative shall complete the form and turn it in to maintenance debrief following the mission.

8.6.3.8. DD Form 1896, *DoD Fuel Identaplate*, is the aircraft fuel and oil charge card.

8.6.3.9. For off-station missions, the PIC will complete or verify accuracy of the AF Form 15, AF Form 664, AFTO 781H, DD Form 1898, and associated fuels receipts then place them in the AF Form 664 (use eight digits for all USAF aircraft tail number entries). The PIC will transmit all AF Form 664 information via phone, fax, or message if mission causes him/her to be off-station past the last day of the month (unless addressed in the unit supplement to this AFI).

8.6.3.10. Mexican non-DESC-contract refuelings. There are no changes when refueling at the following non-DESC-contract Mexican locations and identified merchant(s): Monterrey (ICAO - MMY) Aero Servicios Monterrey; Monterrey (ICAO - MMAN) Aero Corporacion Azor, Asertec, Avianet Intl de Mexico, Aeroservicios Monterrey; Puerto Vallarta (ICAO - MPR) Aerotron; Sotillo (ICAO - MMIO) Services Est Aero, Mexhaga; Toluca (ICAO - MMT) Aerolineas Jecutivas, Avemex, Uvavemex. When refueling is required in Mexico at other than these identified locations/merchants, aircrews should call World Fuel Services at 1-800-345-3818, extension 3 (24 hrs). Direct number is 1-305-428-8000. The call should be made 24 hours ahead of required refueling. Any requirement presented with less than 24 hours advance notice may not be met (but they will work the requirement as best they can to meet the user need). World Fuel Services must make arrangements with the Mexican governmental fueling authority to allow refueling, and the authority's business hours are M-Th, 0900-1400 and 1600-1700; Friday 0900-1400.

8.7. Not Used.

8.8. AMC Form 54, Aircraft Commander's Report on Services/Facilities. The AMC Form 54 is a tool to report level of excellence for services encountered during mobility operations. Be quick to identify outstanding performers and attempt to resolve problems at lowest level practical. PICs should advise affected agency on their intent to submit an AMC Form 54. Provide a copy of the completed form to local station AMC C2 agency. Upon return to home station, PICs will coordinate form with SQ/CC and OG/CC. For AMC Form 54s that require AMC coordination, OG/CCs shall review and submit AMC Form 54 to 18AF/CC.

8.8.1. **(Added-MACDILLAFB)** AMC Form 54, *Aircraft Commander's Report on Services/Facilities*. 310 AS/DOV will forward a copy to AMC/A3V and then process the form as outlined in AMCI 11-208. Squadron commanders will be the focal points for all reports submitted by their aircraft commanders and are responsible for tracking the status of the report. This form will be maintained in the trip kit. If unable to submit while on temporary duty (TDY), submit the form to 310 AS/DOV upon returning to home station.

8.9. AMC Form 196, Aircraft Commander's Report on Crew Member. The AMC Form 196 is a tool to document an aircrew member or Mission Essential Personnel's outstanding, below average, or unsatisfactory performance during a mobility mission. Be quick to identify outstanding performers and attempt to solve problems at lowest level practical (provide local senior leaders opportunity to resolve problems as they occur). Send the report to subject's unit commander.

8.10. AMC Form 43, AMC Transient Aircrew Comments. The AMC Form 43 is a tool to report level of excellence for transient facilities. Any crewmember may submit this report whether or not the PIC includes an unsatisfactory item in the trip report. Send completed AMC Form 43 to HQ AMC/A1SC, or MAJCOM equivalent.

8.11. (Added-MACDILLAFB) Local Reports and Forms.

8.11.1. **(Added-MACDILLAFB)** AVISOURCE Mission Database. Aircraft commanders will ensure the following mission information is entered in the Logistics Page of AVISOURCE: crew location remarks to include hotel and transportation information (phone number, fax number, and confirmation numbers, if available); base operations/FBO commercial phone and fax numbers (if available).

8.11.2. **(Added-MACDILLAFB)** Aircraft Commanders Trip Report. The AC trip report is designed to inform the 6 OG/CC of operational problems. Complete a trip report for all CVAM directed missions. Trip reports are optional for OST missions but are highly encouraged. Handwritten reports are acceptable. Turn in one copy of the report with post-mission paperwork.

8.11.3. **(Added-MACDILLAFB)** DD Form 2131, *Passenger Manifest*. The FA will ensure the DD Form 2131 is completed in coordination with the mission contact. See [paragraph 14.4.4.1](#) for more information.

8.11.4. **(Added-MACDILLAFB)** Aircrew Contact Card. CSO will ensure the onboard contact receives an aircrew contact card as needed.

8.11.5. **(Added-MACDILLAFB)** Hot Reports (HOTREP). HOTREPS are time critical reports designed to immediately notify the chain of command of any issues jeopardizing mission reliability, DV connectivity, or DV comfort. These reports are applicable to all CVAM missions carrying a DV. At the discretion of the aircraft commander, they will be initiated as soon as conditions permit, even during flight. HOTREPS are applicable to all CVAM directed missions regardless of the DV status. To initiate a HOTREP, crews will contact the 310 AS/SOC/DO/CC. The SOC or DO will then contact the 310 AS/CC, 6 OG/CC/CD verbally before submitting a draft HOTREP to the 6 OG/CC/CD, who will brief the 6 AMW/CC. The 6 AMW/CC determines if the HOTREP will leave the base and direct the MacDill Command Post to publish the crafted HOTREP to the predetermined list of on and off base agencies. When reporting maintenance issues, the information in the HOTREP should be limited to the facts surrounding the problem without diagnosis, unless the problem is known. The SOC will immediately call the 310 AS/CC and 6 OG/CC to confirm receipt of the HOTREP. Additionally, 310 AS/SOC will relay revised itinerary timing to MacDill Command Post at the earliest opportunity for input into C2 systems.

8.11.5.1. **(Added-MACDILLAFB)** Non-HOTREP Itinerary Deviations. Aircraft commanders will ensure MacDill Command Post is notified of itinerary timing changes so that an “advisory remark” can be inserted into C2/in-transit visibility systems. This advisory should occur in advance of the delay if possible, or as soon as practical otherwise. Typically, these situations occur on departure when the DV party is delayed arriving to the aircraft, or as air traffic control or weather holds occur.

8.11.6. **(Added-MACDILLAFB)** Situation Reports (SITREP). SITREPS are end of day reports designed to update chain of command on the status of CVAM-directed DV missions. They are initiated as soon as practical at the end of each crew duty day with active DV legs. The AC or designated representative will contact the MacDill Command Post with the following information: SITREP required, temp DV code, mission leg #, and a mission status description. The SITREP mission status should normally be Nothing Significant to Report

(NSTR), however the AC may add noteworthy details if necessary. The AC shall verbally brief the SOC on mission status remarks other than NSTR.

Chapter 9

TRAINING POLICY

9.1. Passengers on Training Missions.

9.1.1. Carrying of passengers during initial or re-qualification training will be IAW with AFI 11-401 and this instruction.

9.1.2. Mission qualification training, en route evaluations, OSTs, and line development missions may be conducted on missions with passengers provided the individual in training is qualified (completed aircraft evaluation with a valid AF Form 8).

9.1.3. Multiple practice approaches will not be accomplished with passengers. **EXCEPTION:** When approved by the parent MAJCOM/A3, maintenance and civilian employees, under direct contract to the DoD and engaged in official direct mission support activities, considered mission essential may be onboard when touch-and-go landings are performed providing the mission is a designated training flight and an IP or EP is in command.

9.2. Touch and Go Landing Limitations. Practice touch-and-go landings only on designated training, evaluation, and currency missions.

9.2.1. Touch-and-go landings. May be performed by:

9.2.1.1. Instructor pilots, instructor pilot candidates on initial or re-qualification instructor evaluations, and flight examiner pilots from either seat.

9.2.1.2. Any pilot from either seat provided that an instructor pilot, instructor pilot candidate on initial or re-qualification instructor evaluation, or flight examiner pilot is in the other seat.

9.2.1.3. **(Added-MACDILLAFB)** Transition Training. CVAM and 6 OG/CC have approved transition training on pre-position (low approaches only) and de-position legs. **NOTE:** 310 AS/CC/DO may approve touch and go landings on a limited basis. Chapter 9 restrictions apply.

9.2.2. Wind and runway restrictions. Comply with wind restrictions, RCR and crosswind limits, and runway requirements in chapter 5 of this AFI. Do not exceed the normal or recommended zone of FCM takeoff and landing crosswind component charts.

9.2.3. Weather. The minimum reported weather required to perform touch-and-go landings is 300 foot ceiling and RVR 40 (3/4-mile visibility without RVR).

9.2.4. Passengers. Touch-and-go landings with passengers are prohibited. Touch-and-go landings with MEPs are authorized.

9.2.5. Reverse thrust. Do not place the throttles in reverse or below flight idle (except C-20B) during a touch-and-go landing. Rejected takeoffs will not be practiced.

9.2.6. Heavy jets. Do not perform touch-and-go landings when 747, C-5 or 757 aircraft are operating in the VFR pattern. **EXCEPTION:** C-32 and VC-25 aircraft are only restricted to a minimum of 2 minutes spacing.

9.2.7. Stop-and-go-landings. Stop-and-go-landings are not authorized.

9.2.8. Minimum Runway for Touch and Go Landings. The minimum runway for touch and go landings is per the FCM or [Table 9.1](#), whichever is greater. For all aircraft, ensure aircraft performance assures full stop capability corrected for [configuration, pressure altitude (density altitude if appropriate), temperature, RCR/RSC and crosswinds] per FCM.

Table 9.1. Minimum Runway Length for Touch and Go Landings.

MDS Aircraft Type	Minimum Runway Length
C-9	7000' (1)
C-20/C-37	5,000'/1667m (1, 2)
C-32/C-40	6,000'/1829m (1)
VC-25	(1)
NOTES: 1. The PAG/CC specifies minimum runway requirements for Presidential Aircraft operations. 2. C-37 partial flap touch and go landings require a minimum of 7000'.	

9.3. Tactical Training. Accomplish tactical training, including tactical descents, arrivals, and departures IAW AFI 11-2SAM-CSM-DVGV1, this AFI, applicable AFTTPs, and local guidance. Observe aircraft operating limits at all times. Reference chapter 19 of this AFI.

9.4. Simulated Emergency Flight Procedures.

9.4.1. Simulated emergency procedures other than engine-out approaches and landings will be limited to non-critical phases of flight and will be kept to a minimum at night or in IMC. Simulated emergency procedures will only be conducted under direct supervision of an IP. Use a realistic training/evaluation approach and do not compound emergencies.

9.4.2. Special Maneuvers. Refer to applicable MDS directives or approved Stan/Eval checklist handouts or guides for procedures to accomplish simulated emergency flight training and tactical maneuvers that are not covered in the FCM.

9.4.3. Simulated engine failures. Simulated engine failures are not authorized at less than the engine-out minimum control speeds (as published in the FCM) or when any actual emergency exists.

9.4.3.1. Do not perform simulated engine-out approaches at night or in IMC (VC-25 reference [paragraph 9.4.5](#) of this Instruction).

9.4.3.2. AMC. Do not perform simulated engine-out approach training in the aircraft. **EXCEPTIONS:** This paragraph does not apply to PACAF, USAFE, ANG or AFRC. PAG/CC may approve simulated engine-out training on a case by case basis. This authorization is not intended to replace the use of the FTD.

9.4.4. C-32 and C-40. Do not perform simulated emergency procedures or simulated engine out approach training in the aircraft. **EXCEPTION:** PAG/CC may approve simulated emergency procedures or simulated engine-out training on a case by case basis. This authorization is not intended to replace the use of the FTD.

9.4.5. VC-25. The minimum weather for simulated engine-out approaches/landings and no-flap approaches is published circling minimums (use 600/2 if circling minimums are not published) during daylight, and 1000/2 or circling minimums, whichever is higher, at night.

9.4.6. Do not perform no-flap or no-slat approaches at night or in IMC.

9.4.7. **(Added-MACDILLAFB)** Instructor pilots/flight engineers will not pull circuit breakers to simulate abnormal procedures during training sorties.

9.5. Fuel Planning.

9.5.1. Planning Factors for Local Flights. When planning fuel requirements for local flights, consider planned flight training times, planned ground times between locals, and planned minimum landing fuel requirements, IAW chapter 17 of this AFI. Local training flights may be scheduled for more or less flying time with the proper coordination.

9.5.1.1. IPs and EPs will initiate an approach to a full stop landing when fuel on board is equal to or less than the amount specified in chapter 17 as the minimum fuel for landing. Request priority handling from air traffic control if necessary.

9.6. Operating Limitations.

9.6.1. Policy: Unless specifically authorized elsewhere in this section, do not practice emergency procedures that degrade aircraft performance or flight control capabilities (in-flight).

9.6.1.1. In an actual emergency, terminate all training and flight maneuvers practice. Training should be resumed only when the PIC determines it is safe to do so.

9.6.2. Training Maneuver Restrictions. The following training maneuver restrictions apply to all applicable MDS aircraft unless specific aircraft are listed. Use **Table 9.2** Training Maneuver Restrictions and minimum altitudes.

Table 9.2. Training Maneuver Restrictions.

Maneuver	Altitude Restrictions	Other Restrictions
Actual Engine Shutdown C-9, C-20, C-32, C-37, C-40, VC-25	5,000 feet AGL Minimum	Do not practice actual engine shutdown unless required for an FCF or for an FCF training flight. Under no circumstances will an engine be shutdown for engine out landing or missed approach training.
Any Simulated Emergency On Takeoff	Initiate at or above 500 feet AGL	For simulated engine failure on takeoff, IP must guard incorrect rudder.

On Approach	Initiate at or above 500 feet AGL	
Simulated Engine Out Go-Around or Missed Approach C-9 C-20, C-32*, C-37, C-40*, VC-25 *PAG/CC approval required	Initiate at or above 500 feet AGL Initiate at or above 200 feet AGL	In the event of an unplanned go-around/missed approach below 500' AGL (C-9) or 200' AGL (all others), use all engines. IP must guard incorrect rudder. On C-9 IP upgrade and evaluation flights, descent to 300 feet AGL is authorized provided both engines are used for the go-around.
Approach to Stalls C-9, C-20, C-37, C-40	10,000 feet AGL minimum	Limited to day VMC conditions. Do not accomplish unless required for FCF training, certification, or accomplishment.
Restricted Low Approaches-Men and/or Equipment On Runway	Initiate at or above 500 feet AGL	None
Planned VFR Go-Arounds With Simulated Emergencies Other Than Engine Out	Initiate at or above 100 feet AGL	None
Simulated Landing C-20, C-37, C-40	Initiate at or above 50 feet AGL	Limited to weather required for circling minimums. (See Note)
Steep Turns	5,000 feet AGL minimum	Limited to day, VMC conditions.
Slow Flight and Flight on the Back Side of the Power Curve C-9, C-20, C-32, C-37, C-40, VC-25	10,000 feet AGL minimum	Limited to day, VMC conditions.
NOTE: Simulated Landings. Use this procedure only when conducting simulated landing training and not to practice missed approaches; it allows simulated training in restricted aircraft when the objective is to practice setting up the correct landing picture. Begin the go-around no later than approximately 2,000 feet remaining. No simulated emergencies allowed. Use the normal landing configuration: Gear down, flaps 30/40 for the C-40, flaps 20/39 for the C-20/C-37. All other training restrictions apply.		

9.7. Prohibited In-Flight Maneuvers. The following maneuvers will only be accomplished in the simulator and not practiced or demonstrated in-flight:

- 9.7.1. Simulated engine-out takeoffs
- 9.7.2. Aborted takeoffs
- 9.7.3. Full stalls
- 9.7.4. Unusual attitudes
- 9.7.5. Dutch roll demonstrations
- 9.7.6. Simulated emergency descents
- 9.7.7. No-flap landings
- 9.7.8. No-flap approaches (except C-9, C-20, C-37, and VC-25)
- 9.7.9. No-slat landings
- 9.7.10. Simulated jammed stabilizer approach and landings
- 9.7.11. Split flap landings
- 9.7.12. Landing with inoperative hydraulic system
- 9.7.13. Rudder boost-off landing
- 9.7.14. Simulated two engine out flight
- 9.7.15. Tactics maneuvers (except MAJCOM approved tactics maneuvers)

9.8. Instructor Pilot Briefing. Before all training and evaluation missions, instructors and evaluators will thoroughly brief their crews on all aspects of the mission according to locally developed briefing guides. Briefing guides will be approved by unit OG/OGV.

9.9. Debriefing. Instructors and flight examiners will accomplish the following:

- 9.9.1. Review and evaluate overall training performed.
- 9.9.2. Review training requirements fulfilled for each student and aircrew member.
- 9.9.3. Answer technical questions.
- 9.9.4. For crewmembers requiring further training, assign specific areas for further study prior to the next training period.
- 9.9.5. Complete training and evaluation records.

9.10. Simulated Instrument Flight. Artificial vision restricting devices are not authorized for any phase of flight. Simulated instrument flight may be flown and logged without the use of a vision restricting device.

9.11. CAT II/III ILS and EVS Approach Training.

9.11.1. CAT II/III training and evaluations may be conducted at any ILS facility where signal output is accurate and stable enough to achieve the desired training.

9.11.1.1. Weather. No lower than 200-foot ceiling and 1/2-mile visibility (RVR 24) or Category I minimums, whichever is greater.

9.11.1.2. Winds. Maximum crosswind component will be IAW 5.15.8 of this regulation.

9.11.1.3. When a CAT II DH is not published, DH will be based on HAT of 100 feet.

9.12. (Added-MACDILLAFB) Authorized Local Training Airfields. Refer to [Table 9.3](#), “310 AS Approved Training Airfields”. If a desired airfield is not listed, the IP must obtain approval from the 310 AS/DO prior to conducting training. Many of the fields listed below have multiple ASRR and IFR Supplement restrictions. It is the instructor aircraft commander’s responsibility to verify the suitability of any training airfield (i.e., NOTAMs, runways, lighting, obstacle clearances, fire suppression, operating hours, bird hazards, taxi limitations, TFRs, PPRs, etc.). Report training airfield suitability concerns immediately to 310 AS/SOC who, in turn, will advise the 310 AS/DO and 6 OG/OGV. Safety is the primary consideration.

Table 9.3. (Added-MACDILLAFB) 310 AS Approved Training Airfields

AIRFIELD	ICAO	Dist to MCF	Longest Runway	Notes
Daytona Beach	DAB	111	10,500	<i>ILS, RNAV, LOC BC, VOR and Radar approaches</i>
Executive/Orlando Executive	ORL	76	6,003	<i>ILS, RNAV, LOC BC, VOR/DME approaches</i>
Fort Myers/Southwest Florida	RSW	89	12,000	<i>ILS, RNAV, VOR/DME, TACAN approaches</i>
Gainesville Regional	GNV	111	7,504	<i>ILS, RNAV, VOR, VOR/DME and Radar approaches</i>
Homestead ARB	HST	183	11,201	<i>HI-ILS, HI-TACAN, ILS, LOC/DME, TACAN</i>
Hunter AAF	SVN	259	11,375	<i>ILS, RNAV, VOR/DME, VOR, NDB, and Radar approaches</i>
Jacksonville Int'l	JAX	164	10,000	<i>HI-ILS, HI-TACAN, ILS, RNAV, VOR/DME, NDB and Radar app</i>
Jacksonville NAS Towers Field	NIP	150	8,000	<i>HI-TACAN, RNAV, TACAN, Radar app</i>
Jacksonville/Cecil Field	VQQ	146	12,504	<i>ILS, GPS, and VOR approaches</i>
Lake City Municipal **	LCQ	139	8,001	<i>RNAV and NDB approaches</i>
Lakeland Linder Regional	LAL	28	8,500	<i>ILS, RNAV, VOR, and NDB approaches</i>
Ocala Int'l/Jim Taylor Field	OCF	81	6,747	<i>ILS, RNAV, and VOR approaches</i>
Palm Beach Int'l/West Palm Beach	PBI	148	9,197	<i>ILS, RNAV, and VOR approaches</i>
Patrick AFB	COF	104	9,023	<i>ILS, LOC/DME, VOR/DME, and TACAN approaches</i>

Sarasota/Bradenton Int'l	SRQ	28	9,503	<i>ILS, RNAV and VOR approaches</i>
Savannah Hilton Head	SAV	265	9,351	<i>HI-ILS, ILS, RNAV, VOR/DME and TACAN approaches available.</i>
Space Coast Regional/Titusville	TIX	100	7,319	<i>ILS and RNAV approaches available.</i>
Tallahassee Regional	TLH	178	8,000	<i>HI-ILS, HI-VOR/DME, HI-TACAN, ILS, RNAV, VOR/DME, VOR, TACAN, NDB and radar approaches available.</i>
**Daylight Only Note: IP must verify airfield suitability prior to each training sortie.				

Chapter 10

AIRCREW OPERATIONS IN CHEMICAL, BIOLOGICAL, RADIOLOGICAL, AND NUCLEAR THREAT ENVIRONMENT

10.1. Overview. The proliferation of Chemical, Biological, Radiological, and Nuclear (CBRN) weapons and the means to deliver them present serious security threats to the global operations of air mobility forces. This chapter describes the CBRN threat, passive defense measures to mitigate that threat, and guidance for ground and flight operations in a contaminated environment. If crews are not trained or equipped to operate in the CBRN environment, this chapter is for information only.

10.2. Understanding the CBRN Threat.

10.2.1. Chemical Weapons. Militarily significant chemical weapons include nerve, blister, choking, and blood agents. A key point for aircrew members to remember is that time is on your side. The ultra-violet (UV) rays of the sun, high temperatures, and high absorption rates of chemicals all decrease their lethality. Most chemical agents will either evaporate or absorb into surfaces. For decontamination, cleaning with hot soap and water and/or a 5 percent bleach solution currently appears to be the best and most practical method of removing chemical agents that may remain as a contact hazard on glass, and unpainted metal. Currently, the only decontaminate authorized for use on aircraft is soap and water. NOTE: Recent tests indicate that as a decontaminated aircraft dries, the absorbed chemical warfare agent (CWA) may resurface from painted surfaces causing contact and vapor hazards.

10.2.2. Biological Weapons. Biological warfare agents (BWA) are normally divided into three areas: bacteria (i.e., Anthrax) that live outside the cell, reproduce, and are normally susceptible to antibiotics; toxins (i.e., Ricin), that are poisons produced by living organisms or plants; and viruses (i.e., Smallpox) that normally require the host of a living cell to survive and reproduce. Viruses and toxins do not respond to antibiotics. It is probable that the medical community would be the first to recognize that an upsurge in “flu-like symptoms” is actually a bio attack. Although BWA are degraded by UV rays, humidity and high/low temperatures, some BWA (i.e., Anthrax spores) may have a long life, lasting decades under the right conditions. Current immunizations and good personal hygiene help prevent infection.

10.2.3. Radiological Weapons. The radiation dispersal device (RDD), or so-called “dirty bomb,” is the typical radiological weapon. RDD is any device that disseminates radioactive material without using a nuclear detonation. Key points to remember are that shielding and distance are the best defenses against radiation exposure.

10.2.4. Nuclear Weapons. The threat from a nuclear device is from the initial blast, heat, and radiation. In addition, the Electromagnetic Pulse (EMP) from a nuclear detonation can damage electronic equipment. The best protection is a combination of shielding, distance from the blast, and limited time of exposure.

10.3. CBRN Passive Defense Measures. Passive defense measures are those activities conducted to negate, contain, and manage the effects of CBRN attack. Passive defense measures

include pre, trans, and post-attack actions designed to mitigate the CBRN threat through contamination avoidance, protection, and contamination control.

10.3.1. Contamination Avoidance. Contamination avoidance is the most important passive defense measure. Techniques for contamination avoidance include: inflight diversion, survival launch, and minimizing exposure to contaminated cargo, aerospace ground equipment (AGE), and material handling equipment (MHE).

10.3.1.1. Inflight Diversion. When advised that a destination airfield is under CBRN attack or has been contaminated, the aircrew will divert to an uncontaminated airfield, if at all possible. Authority to land at a contaminated airfield will be specified in the controlling OPOD.

10.3.1.2. Survival Launch. If caught on the ground during attack warning, every reasonable effort will be made to launch to avoid the attack. Upon proper clearances, aircrew may launch to survive if they have sufficient fuel and unrestricted, safe access to the runway. In practice, this option may only be practical for aircraft that have just landed or aircraft at or near the end of the runway. If launch is not possible, shut down engines and avoid running environmental control systems. Close aircraft doors, don Individual Protective Equipment (IPE), and seek personal protective cover on the base. If time does not permit using base facilities, remain in the sealed aircraft for a minimum of one-hour after the attack and/or follow host-base guidance.

10.3.1.3. Avoiding Cross Contamination from AGE, MHE, and Cargo. All formerly contaminated equipment and cargo must be marked to facilitate contamination avoidance and the use of protective measures. Additionally, the air shipment of formerly contaminated cargo requires special precautions and must be specifically authorized by the senior transportation commander.

10.3.2. Protection. When exposure to chemical and/or biological agents cannot be avoided, protection provides the force with the ability to survive and operate in a CBRN environment. Protection is afforded by individual protective equipment, collective protection, and hardening of facilities.

10.3.2.1. Individual Protective Equipment. The current in-flight protective gear for aircrew members is the Aircrew Chemical Defense Ensemble (ACDE). The ACDE includes the newer Aircrew Eye-Respiratory Protection System (AERPS) above the shoulders and the CWU-66/P or CWU-77/P Integrated Aircrew Chemical Coverall (IACC). The Ground Crew Ensemble (GCE) consists of the protective mask, C2 series canister (or filter element for MCU-2A/P protective mask), and over garment, boots, and gloves. The ACDE and GCE provide protection against chemical and biological agents. They do not provide blast or radiation protection from an RDD or nuclear detonation. The ACDE requires care during donning using "buddy dressing" procedures and Aircrew Life Support (ALS) expertise during processing through the Aircrew Contamination Control Area (ACCA). (**NOTE:** AECMs will utilize the MCU-2A series mask).

10.3.2.1.1. ACDE/GCE Issue. Aircrews will be issued sized ACDE and GCE at home station. Aircrews will ensure their ACDE and GCE are available at all times while in a CBRN threat area. Aircrew members will confirm the mobility bag contents and correct sizes.

10.3.2.1.2. ACDE Wear During Ground Operations. Because aircraft contamination is unlikely to occur during flight, ground operations can represent the highest threat to aircrew safety. Protection from enemy attacks and exposure to liquid chemical agents is paramount. Aircrew should limit activities to essential duties only, and separate ground duties from air duties.

10.3.2.2. Collective Protection. Collective protection provides a temperature-controlled, contamination-free environment to allow personnel relief from continuous wear of IPE such as the ACDE. The basic concept for most facility collective protective solutions is to employ overpressure, filtration, and controlled entry/exit. The intent is to provide rest and relief accommodations, as well as provide medical treatment in contamination free zone. All pressurization systems should be shut down and doors sealed if the crew finds itself in need of immediate protection. Crewmembers should avail themselves of facilities, if provided, on the airfield.

10.3.2.3. Hardening. Permanent and expedient hardening measures are used to strengthen buildings and utility systems or provide barriers to resist blast effects. To reduce the potential of vapor exposure, personnel should consider the use of facilities above the first floor.

10.3.3. Contamination Control. In the post-attack environment, contamination control measures limit the spread of chemical, biological, and radiological contamination through disease prevention measures, decontamination, and use of Exchange Zone (EZ) operations. Effective contamination control helps sustain air mobility operations by minimizing performance degradation, casualties, or loss of material.

10.3.3.1. Disease Prevention. Up-to-date immunizations, standard personal hygiene practices, and the use of chemoprophylaxis are effective biological warfare defensive measures.

10.3.3.2. Decontamination.

10.3.3.2.1. Inflight Decontamination. Air washing is a useful inflight decontamination technique for removing most of the liquid agent from aircraft metal surfaces. However, vapor hazards may remain in areas where the airflow characteristics prevent complete off-gassing (i.e., wheel wells, flap wells, rivet and screw heads, joints, etc.). Flights of at least 2 to 4 hours are recommended, and lower altitudes are more effective than higher altitudes. Fly with the aircraft configured (gear, flaps, and slats extended) as long as possible to maximize the airflow in and around as many places as possible. Be advised that exterior contamination may seep into the aircraft interior creating a vapor hazard for aircrews. Use of ACDE is recommended.

10.3.3.2.2. Limits of Decontamination. Complete decontamination of aircraft and equipment may be difficult, if not impossible, to achieve. Formerly contaminated assets will be restricted to DOD-controlled airfields and not released from US government control.

10.3.3.3. Exchange Zone (EZ) Operations. The AMC Concept for Air Mobility Operations in a Chemical and Biological Environment (CB CONOPS) describes a method for continuing the vital flow of personnel into a contaminated airfield while

limiting the number of air mobility aircraft and personnel exposed to the contaminated environment. The purpose of the EZ is to minimize the spread of contamination within the air mobility fleet, preserving as many aircraft as possible for unrestricted international flight. The EZ is an area (located at uncontaminated airfield) set aside to facilitate the exchange of uncontaminated (clean) cargo/passengers to a contaminated (dirty) airframe, or visa versa, without cross-contamination. Additional information on the EZ is available through HQ AMC/A3X.

10.4. Flight Operations.

10.4.1. Mission Planning. Aircrews must be mentally prepared to face the dangers of CBRN weapons. Flight/mission planning must be thorough. Aircraft commanders should emphasize ACDE wear, crew coordination, CBRN hazards and countermeasures, inflight diversion, plans for onload/offload in the event of a ground attack, and plans for the return leg in the event of aircraft contamination. Alternative scenario plans should also be considered in the event MOPP conditions change.

10.4.2. Establishing the Threat Level. Aircrews should monitor command and control channels to ensure they receive the latest information concerning the destination's alert condition. Diversion of aircraft to alternate "clean" locations may be required, unless operational necessity otherwise dictates. The TACC or theater C2 agency (normally through the controlling OPORD) will direct aircrew pre-exposure activities such as medical pre-treatment for chemical/biological exposure.

10.4.3. Fuel Requirements. Extra fuel may be needed to compensate for altitude restrictions as the result of CB agent exposure. During purge periods, the aircraft will be unpressurized. Although the aircrew can use the aircraft oxygen systems, passengers wearing GCE cannot, thus restricting the aircraft cruise altitude and increasing fuel requirements accordingly.

10.4.4. Oxygen Requirements. Operating a contaminated aircraft will increase oxygen requirements. Aircrew wear of ACDE will require use of the aircraft oxygen system to counter actual/suspected contamination. Using the 100 percent oxygen setting offers the greatest protection in a contaminated environment. Appropriate oxygen reservoir levels must be planned to meet higher consumption rates. Use the aircraft Dash 1 charts to calculate the required reservoir levels.

10.4.5. Donning Equipment. Aircrew will don ACDE based on the alarm condition (See Airman's Manual (AFMAN 10-100). Use the "buddy dressing" procedures, and refer to AMCVA 11-303, *AERP Donning Checklist* and AMCVA 11-304, *ACDE Donning Checklist*, to ensure proper wear. When wearing the ACDE, Atropine and 2 PAM Chloride auto injectors will be kept in the upper left ACDE pocket. If the integrated survival vest/body armor is worn, the Atropine and 2 PAM Chloride auto injectors may be kept in the lower right flight suit pocket. This standardized location will enable personnel to locate the medication should an individual be overcome by CWA poisoning. M-9 paper on the flight suit will facilitate detection of liquid chemical agents and ACCA processing. M-9 paper should be placed on the flight suit prior to entering the CBRN threat area or when an alarm "yellow" or higher has been declared. When inbound to a CBRN threat area, prior to descent, the aircraft commander will ensure crew and passengers don appropriate protective equipment IAW arrival destination's MOPP level and brief aircrew operations in the CBRN threat area. As a minimum, this briefing will include: flight deck isolation, oxygen

requirements, air conditioning system requirements, IPE requirements, ground operations, and MOPP levels. Aircrew members must determine if the wear of the integrated survival vest/body armor and LPUs will restrict dexterity and mobility to the point that it becomes a safety issue. If the aircrew deems the equipment to create a safety of flight concern, then the items may be pre-positioned (instead of worn) on the aircraft to be readily available to the aircrew.

10.4.6. Communicating Down-line Support. Pass aircraft and cargo contamination information through command and control channels when inbound. This information will be used to determine if a diversion flight is required or decontamination teams are needed. Report the physical condition of any crew/passengers who are showing agent symptoms and whether they are wearing chemical defense ensembles.

10.5. Ground Operations.

10.5.1. Crew Rest Procedures. Operational necessity may require the aircrew to rest/fly in a contaminated environment. If the mission is not being staged by another aircrew or pre-flight crews are not available, the aircrew may pre-flight, load, and secure the aircraft prior to entering crew rest. The departing aircrew will perform necessary crew preparations and pre-flight briefings. Then, they will report to the ACCA for processing and ACDE donning with assistance from ALS personnel. If possible, aircrew transport should be provided in a covered vehicle. Aircrews should avoid pre-flying the aircraft prior to departure to prevent contamination spread to them and/or the aircraft. As aircrews proceed to fly, they will require assistance from ground support personnel in removing their aircrew protective overcape and overboots prior to entering the aircraft.

10.5.2. Onload and Offload Considerations. Extreme care must be exercised to prevent contamination spread to the aircraft interior during ground operations, particularly to the flight deck area. Reduce the number of personnel entering the aircraft. Contaminated engine covers, safety pins and chocks will not be placed in the aircraft unless sealed in clean plastic bags. Aircrew members entering the aircraft will remove plastic overboots and overcape portions of the aircrew ensemble and ensure flight/mobility bags are free of contaminants and placed in clean plastic bags. Prior to entering the aircraft all personnel should implement boot wash/decontamination procedures. Aircrew exiting aircraft into a contaminated environment will don plastic overboots and overcape prior to leaving the aircraft.

10.5.3. Communications. Conducting on/offloading operations, while wearing the complete ACDE, complicates communications capability. Use the mini-amplifier/speaker or the aircraft public address system and augment with flashlight and hand signals, as required.

10.5.4. Airlift of Retrograde Cargo. Only CRITICAL retrograde cargo will be moved from a contaminated to an uncontaminated airbase. Critical requirements are pre-designated in theater war plans. Onload cargo will be protected prior to and while being transported to the aircraft. If contaminated, protective cover(s) will be removed/replaced just prior to placing the cargo on the aircraft. It is the user's responsibility to decontaminate cargo for air shipment. The airlift of contaminated or formerly contaminated cargo requires the approval of the senior transportation commander.

10.5.5. Passenger/Patients. A path should be decontaminated between the aircraft and the ground transportation vehicle to reduce interior contamination when loading/unloading

passengers/patients. Normally, externally contaminated patients and those infected with contagious biological agents will not be transported onboard AMC or AMC-procured aircraft. The AMC/CC is the waiver authority to this policy. (**NOTE:** An altitude below 10,000 feet is recommended due to AECM use of the ground chemical mask.)

10.5.6. Physiological Factors. Aircraft commanders must be very sensitive to the problems resulting from physical exertion while wearing ACDE. The aircraft commander should consider factors such as ground time, temperature and remaining mission requirements when determining on/offload capabilities. Individuals involved should be closely monitored for adverse physiological effects.

10.5.7. Work Degradation Factors. Work timetables need to be adjusted to minimize thermal stress caused by wearing the ACDE. Aircrews must weigh all factors when performing in-flight and ground duties. The following are degradation factors for wearing full GCE, and may also be used to represent the Task Time Multipliers for the ACDE. To estimate how much time it takes to perform a task or operation, (1) take the Task Time Multiplier (Figure 10.1) for the appropriate Work Rate and ambient air temperature and (2) multiply it by the time it normally takes to perform the task. For example, given a heavy work rate and an air temperature of 70F, the crewmember should expect a normal one hour task to take 2.1 hours while wearing ACDE. A more extensive discussion of this subject is found in AFMAN 32-4005, *Personnel Protection and Attack Actions*.

Figure 10.1. Task Time Multipliers.

Work Rate	Temperature		
	20-49 F	50-84 F	85-100 F
	-6 to 9 C	10 to 28 C	29 to 38 C
Light	1.2	1.4	1.5
Moderate	1.3	1.4	3.0
Heavy	1.7	2.1	5.0

10.5.8. Outbound with Actual/Suspected Chemical Contamination. Once airborne with actual/suspected vapor contamination, the aircraft must be purged for 2 hours using Smoke and Fume Elimination procedures. To ensure no liquid contamination exists, a close inspection of aircrew, passenger ensembles, and cargo will be conducted using M-8 and M-9 detection paper. Detection paper only detects certain liquid agents and will not detect vapor hazards. Above the shoulder ACDE should only be removed if there is absolutely no vapor hazard. Be advised that residual contamination (below the detectable levels of currently fielded detection equipment) may be harmful in an enclosed space. The aircrew must take every precaution to prevent spreading of liquid contaminants, especially on the flight deck area. The best course is to identify actual/suspected contamination, avoid those areas for the remainder of the flight, and keep the cargo compartments cool. If an aircrew member or passenger has been in contact with liquid contaminants, all personnel aboard the aircraft will stay in full ACDE/GCE until processed through their respective contamination control area (CCA). Upon arrival, the contaminated aircraft will be parked in an isolated area and cordoned to protect unsuspecting ground personnel.

10.5.9. Documenting Aircraft Contamination. When it is suspected or known that an aerospace vehicle or piece of equipment has been contaminated with a radiological,

biological or chemical contaminant, a Red X will be entered and an annotation will be made in historical records for the lifecycle of the equipment.

10.5.10. 10-Foot Rule. The 10-foot rule was developed in order to provide guidance for protecting personnel using or handling contaminated resources (such as pallets) or working in locations with materials that might retain a residual chemical. The 10-foot rule embodies a safety factor that goes beyond current OSD guidance (which allows removal of IPE whenever detectors no longer detect a chemical agent vapor hazard). There are two phases associated with the 10-foot rule.

10.5.10.1. Initial Phase. During the initial phase, personnel will remain in MOPP 4 whenever they stay within 10 feet of the contaminated equipment for more than a few seconds. This MOPP level provides personnel the maximum protection from the chemical agent as it transitions from a contact and vapor hazard to a vapor hazard only.

10.5.10.2. Follow-on Phase. In the follow-on phase, personnel will use gloves of a sort (i.e. leather, rubber, cloth, etc.) when operating on or handling the contaminated equipment. Although a contact hazard is unlikely, relatively small amounts of the agent may still be present. The use of gloves will ensure that unnecessary bare skin contact with agent residue is avoided.

10.5.10.3. Figure 10.2 shows times associated with initial and follow-on phases of the 10-foot rule. To simplify response processes, commanders may choose to use the worst case scenario as the foundation for all 10-foot rule actions, i.e., 24 hours for the initial phase and all periods of time greater than 24 hours for the follow-on phase.

Figure 10.2. Ten-Foot Rule Time Standards (Source: AFMAN 10-2602).

"10-Foot Rule" Time Standards*		
Agent	Initial Phase	Follow-on Phase
HD	0-12 hrs	Greater than 12 hrs
GB	0-12 hrs	Greater than 12 hrs
GD, GF, GA	0-18 hrs	Greater than 18 hrs
VX, R33	0-24 hrs	Greater than 24 hrs
* Rule is based on expected contamination on an airbase following a chemical attack. Adjust times if agent concentration is higher than expected.		

Chapter 11

NAVIGATION PROCEDURES

11.1. Mission Planning.

11.1.1. The PIC or designated representative shall verify that proposed routes and flight altitudes/levels provide proper terrain clearance and meet FLIP, FCG and AOR requirements.

11.1.2. A pilot/navigator shall crosscheck the CFP route of flight against the route of flight entered on the DD Form 175, *Military Flight Plan*, DD Form 1801 or ICAO flight plan.

11.1.3. If a CFP is out of date or not available and routing or meteorological information is desired, the PIC should obtain direct assistance from the CDS or IFM. CFPs and CFP tracks to assist in manual flight planning are available with a current account through the AMC Aircrew Portal.

11.1.4. Flight Plan. Cross-check the CFP planned route against the route of flight entered on the DD Form 175 or DD Form 1801 and the approved diplomatic clearance.

11.1.5. Navigator Station (if applicable). The navigator who prepares or accepts the flight plan will remain on duty at the navigator's station during departure and will brief the relieving navigator. The navigator ensures all required fuel computations are accurate and complete, and, in addition, will ensure ramp fuel load is compatible with mission requirements.

11.2. Flight Charts. Complete oceanic plotting IAW para 6.33.3. of this AFI.

11.3. Navigational Aid Capability. The following airspace categories are each defined in FLIP, and are considered special qualification airspace: MNPS, Reduced Vertical Separation Minimum (RVSM), Basic Area Navigation (BRNAV), and RNP.

11.3.1. North Atlantic MNPS airspace system procedures are as follows:

11.3.1.1. MNPS standards are mandatory.

11.3.1.2. Aircraft that lose one INS/IRS prior to airspace entry will comply with North Atlantic MNPS Airspace Operations Manual (as applicable) and appropriate FLIP series. Although the North Atlantic MNPS Airspace Operations Manual is not regulatory for airspace other than North Atlantic MNPS operations, it provides solid general guidance for operations in other oceanic regions.

11.3.1.3. Aircraft that lose all INS/IRS capability prior to designated airspace entry may continue if the crew re-files outside MNPS airspace and NAVAIDs (or navigator) are available to maintain proper navigation tolerances.

11.3.2. RVSM Airspace. Airspace where RVSM is applied is considered special qualification airspace. Both the operator and the specific aircraft type must be approved for operations in these areas. Refer to FLIP AP/2 and the following for RVSM requirements:

11.3.2.1. Both primary altimeters, at least one autopilot, the altitude advisory system, and the transponder, must be fully operational. The PIC will request a new clearance to avoid this airspace should any of this equipment fail.

11.3.2.2. Engage the autopilot during level cruise, except when circumstances such as the need to re-trim the aircraft or turbulence require disengagement.

11.3.2.3. Crosscheck the altimeters before or immediately upon coast out. Record readings of both altimeters.

11.3.2.4. Continuously crosscheck the primary altimeters to ensure they agree ± 200 feet.

11.3.2.5. Limit climb and descent rates to 1,000 feet per minute when operating near other aircraft to reduce potential TCAS advisories.

11.3.2.6. Immediately notify ATC if any of the required equipment fails after entry into RVSM airspace and coordinate a plan of action.

11.3.2.7. Document in the aircraft forms malfunctions or failures of RVSM required equipment.

11.3.3. **BRNAV Airspace.** Airspace where BRNAV is applied is considered special qualification airspace. Both the operator and the specific aircraft type must be approved for operations in these areas. BRNAV navigation accuracy criteria is RNP-5. Aircraft with integrated GPS have no BRNAV restrictions. Without GPS, aircraft must auto update every two hours (as required) to maintain actual centerline within ± 5 NM of ATC cleared route.

11.3.3.1. Minimum equipment to operate in BRNAV airspace is one INS/IRS capable of updates or an FAA approved GPS with RAIM or equivalent system. Flights entering BRNAV airspace after long overwater flight must be especially aware of BRNAV tolerances and update accordingly.

11.3.3.2. Aircraft unable to maintain BRNAV tolerances must advise ATC immediately and take appropriate coordinated action.

11.3.3.3. Document (in the aircraft forms) malfunctions or failures of BRNAV required equipment, including the failure of this equipment to meet BRNAV tolerances.

11.3.4. **RNP Airspace.** Airspace where RNP is applied is considered special qualification airspace. Both the operator and the specific aircraft type must be approved for operations in these areas. RNP airspace is being incorporated around the world to increase air traffic capacity by decreasing separation requirements between routes. VIP Aircraft are approved for RNP, but limited to operational time restrictions based on navigation equipment. These limitations will be annotated in local supplement and updated by unit stan/eval when appropriate.

11.3.4. **(MACDILLAFB) Required Navigation Performance (RNP) Airspace.** Limitations: Refer to GV AFM/AOM Limitations section for guidance with degraded equipment.

11.3.4.1. **RNP-10.** Compliance includes navigation accuracy within 10NM of actual position 95% of the time. Aircraft not possessing integrated GPS with RAIM, or equivalent system, are limited in how long they may operate in RNP-10 airspace. The following are RNP-10 requirements:

11.3.4.1.1. **Flight Planning.** Verify aircraft is approved for RNP operation, assess mission impact and ensure appropriate code is annotated on the flight plan IAW FLIP GP.

11.3.4.1.2. Preflight Procedures. Review maintenance logs to ascertain status of RNP-10 equipment and particular attention should be paid to navigation antennas and the condition of the fuselage skin in the vicinity of these antennas.

11.3.4.1.3. Enroute. At least two long range navigation systems certified for RNP-10 must be operational at the oceanic entry point. Periodic crosschecks will be accomplished to identify navigation errors and prevent inadvertent deviation from ATC cleared routes. Advise ATC of the deterioration or failure of navigation equipment below navigation performance requirements and coordinate appropriate actions.

11.3.4.1.4. Document (in the aircraft forms) malfunctions or failures of RNP required equipment, including the failure of this equipment to meet RNP tolerances.

11.3.5. CPDLC Operations. Refer to applicable FLIP, FAA and MDS guidance for CPDLC operations. Specific operations and procedures must be approved by MAJCOM/A3 with mission execution authority. Verify equipment and ensure appropriate code is annotated on the flight plan IAW FLIP GP.

11.4. Navigator Procedures. Use local supplement to describe duties (if applicable).

11.5. High Latitudes/Grid Navigation/Polar Routes. Operations when flying north of 70 degrees latitude require provisions for conversion of heading systems from magnetic to true, or operations with Grid procedures. Provisions for INS/IRS failure must be considered. Refer to the FCM for specific procedures.

11.5.1. Use of Polar Routes is authorized. Ensure aircraft MEL, performance capability and navigation capability exists for the entire route. Utilize all IFM/CDS functions and review polar route navigation procedures in FLIP (Arctic Control Area, NavCanada, Alaska Supplements, etc.). Follow MDS specific guidance for alternate planning and EROPS, if applicable. Ensure alternates qualify and are suitable for use. Comply with all cold weather/polar operations manual restrictions (fuel temperature, cold weather operations, etc.).

11.5.2. Navigators. Backup grid procedures should be used when flying north of 70 degrees north latitude (except Alaska) and south of 60 degrees south latitude or where the convergence of meridians or magnetic variation changes preclude using true and magnetic direction references.

11.5.2.1. INS/IRS Operation. Set compasses to computed grid heading in order to have a current grid heading available should INS/IRS fail.

11.5.2.2. If INS/IRS fail, aircraft will be directed by grid heading until exiting the grid area.

11.5.3. En route requirements with INS/IRS inoperative:

11.5.3.1. Navigators. Comply with FLIP (Arctic Control Area or other applicable procedures). Check aircraft's grid heading each 30 minutes during the first hour after grid entry. Thereafter, heading checks are required every hour. When entering grid operation, apply convergence to the true heading. Establish the aircraft on computed true heading references. When exiting grid, apply variation to obtain magnetic headings to the flight plan to verify the accuracy of the courses measured and conversion data used.

This will ensure the validity of initial entry headings and provide precise target headings for exit.

11.5.3.2. Determine the precession information for gyros after each heading check. Do not reset the gyros unnecessarily. When precession is one degree or less do not reset the gyros since the error may be in the observation.

11.5.3.3. If a grid heading can't be determined at the regular time interval by celestial, use the previous precession information to determine heading changes.

11.6. EROPS Procedures (C-32 and C-40). An EROPS area of operation shall be considered to be any geographical area where, at any point on the planned route, the aircraft will be more than 60 minutes from an adequate airport at the single-engine drift-down speed and altitude in still air. An EROPS area of operation may also be considered to apply to over-land areas having suitable alternates within 60 minutes (at the single-engine drift-down speed and altitude in still air), but are considered not usable for political, military, security or performance considerations.

11.6.1. Mission Planning. The EROPS area of operation shall be considered and factored into route planning considerations. Use of appropriate extended range flight planning tools is authorized. Adequate airfields shall be identified, reviewed for suitability, and contained in FMC/FMS database.

11.6.1.1. Suitability Planning. Verify weather, airfield, aircraft systems, instrument approach, passenger handling, maintenance support, fire and rescue support, operations hours and NOTAMs determine suitability.

11.6.1.2. Units will publish specific EROPS guidance in local supplement to enhance operational safety. As a minimum, the PIC must have a qualified alternate planned for CAT 1 fuel, and a contingency plan for weather, suitability and MEL/MMEL [e.g. loss of Auxiliary Power Unit, fire detection, generator, etc]. The PIC has the ultimate responsibility for safety.

11.6.1.2.1. C-32 and C-40. These aircraft are considered 180 minute EROPS compliant. To maintain that standard, the unit OG/CC (or equivalent) will evaluate the MEL situation with unit stan/eval and direct as to how the route should be planned and how the aircraft should be operated. OG/CC (or equivalent) will approve any EROPS waiver, or approve a new route conforming to reduced EROPS limits (120, 90, 60 minutes). Unit OGV will pass waiver approval to CP, AMD, CDS or IFM to the crew for go/no-go.

11.7. CDS/IFM. All VIP Aircraft are authorized to utilize MAJCOM approved CDS/IFM (this includes AFMC contracted services as part of aircraft procurement/sustainment if coordinated with the lead command). PIC is overall responsible for monitoring accuracy and completeness of flight planning.

11.7.1. Certified Dispatchers are authorized to mission plan, obtain/transmit weather information, obtain/transmit diplomatic clearance messages, compute flight plans, electronically file and flight follow VIP Aircraft. PIC must verify dispatch release via signature, verbal communication or datalink. At locations with MAF C2, PIC should confirm actions with CP or AMD. Secure Launch and Close Hold missions may require

modification of planning factors. OG/CC or equivalent shall inform PIC if mission is not to be dispatched.

11.7.2. Messages. CDS Dispatchers are not authorized to send official AMHS messages.

11.7.2.1. Close Hold. Units may further restrict CDS activities to accommodate sensitive missions. In such cases, the unit will perform flight planning and dispatch services.

11.7.3. Dip Clearances. Dispatchers may obtain diplomatic clearances. PIC's are responsible for overall border clearance, approval authority for flight plans and country clearance. Verify flight plan annotates appropriate diplomatic clearances for border clearance and safe passage.

11.7.4. Datalink. Use of HF and VHF datalink is approved for enroute dispatch and C2 capability. Dispatchers shall notify PIC of updated alternates and weather prior to obtaining clearances (departure, oceanic, approach). In any case, PICs, Navigators or FEs should update enroute alternate weather prior to oceanic entry point via any means (HF or datalink). MDS specific EROPS may dictate further oceanic restrictions. OG/CCs (or equivalent) are waiver authority for dispatch relief for EROPS. In these cases, dispatchers should contact crew by any/all means for all planning problems or changes. If not able to contact the crew, CDS/IFM must notify ARTCC, unit C2, CP or AMD to pass information to the aircraft.

11.7.4.1. CPDLC. MAJCOM authorized users may use flight following and oceanic clearance release procedures via ATC datalink. Ensure appropriate ATS log-on procedures are followed (Pacific Operations Manual, CNS/ATM Asia, etc). Initiate HF communication (typically 15-45 minutes prior to entry) and establish log on communication. Ensure log on is accepted and advise ATC via HF voice if communication is not established. Minimize the use of free text messages. Maintain log of ATC datalink communications and retain with post mission paperwork at unit stan/eval IAW unit procedures.

Chapter 12

FLIGHT ENGINEER (FE) PROCEDURES

12.1. General. This chapter outlines additional procedures not in the FCM for FEs.

12.2. Responsibilities. The first FE is responsible for the condition of the aircraft, keeps the PIC informed at all times of changes in aircraft status. FEs will supervise or perform aircraft servicing and maintenance at en route stations as required to maintain aircraft in a mission-capable condition. VC-25 FEs supervise the crew chief on missions and lend assistance when required. At the end of each flight, the FE will police the flight deck if there is no CSO onboard.

12.2.1. **(Added-MACDILLAFB)** Engine Start Procedures. FEs will ensure a fire guard/safety observer is in place for all off-station engine starts. If needed, FE will assume this role.

12.3. Authority to Clear Red X Symbols in the AFTO 781A. IAW TO00-20-1, when authorized by the home station maintenance group commander and contracted logistics support (CLS) agreement, FEs are authorized to clear red X write-ups.

12.4. Refueling and Defueling.

12.4.1. Aircraft Refueling and Defueling. Qualified FEs are authorized to refuel or de-fuel their aircraft. Comply with the appropriate dash-2 aircraft TOs, FCMs/Ground Servicing Guides and TO 00-25-172, *Ground Servicing of Aircraft and Static Grounding/Bonding*.

12.4.2. Concurrent Ground Operations. Simultaneous refueling or de-fueling while maintenance operations are being performed is authorized according to TO 00-25-172. **NOTE:** During concurrent servicing for C-9 operations, three way interphone contact will be established between a pilot or other qualified crewmember in the cockpit, fuel servicing crewmember located at the Single Point Refueling (SPR) panel [who may act as Concurrent Servicing Supervisor (CSS)], and safety observer located forward of the nose area (e.g. Pilot, FA, CSO). If interphone communication cannot be established/maintained, an alternate means of communication must be found before refueling may commence/continue.

12.4.2.1. Aircrew members are authorized to enplane or deplane during fuel servicing to perform mission essential duties.

12.4.2.2. Aircrew personnel are authorized to conduct "power off" portions of inspections during servicing when essential to meet operational turn-around requirements (Reference TO 00-25-172, paragraph 3.7.).

12.4.2.3. Passengers may remain on board the aircraft during refueling, provided they are briefed on the hazards of the operation and given the option to deplane prior to refueling. Stairs and exit(s) will be positioned (if required) with doors open. Passengers will not enplane or deplane during fueling operations unless absolutely necessary and escorted by an aircrew member. A standby fire truck is required if servicing with JP-4 or Jet B fuels (Reference TO 00-25-172, paragraph 6.10c.).

12.5. Concurrent Servicing Operations. Concurrent servicing is authorized according to TO 00-25-172. All FEs are qualified to perform CSS duties. The FE is the final authority for coordinating all en route servicing operations.

12.6. Certifications. Flight Engineers are authorized certification in aircraft taxi and engine run procedures.

12.6.1. Taxi Certification. FEs may taxi VIP Aircraft with unit OG/CC approval. FEs will receive instruction from a qualified instructor pilot or examiner pilot IAW the FCM, AFI 11-218, MAJCOM Supplement, and local directives at the discretion of the unit commander. A qualified EP will certify the FE on an AF Form 8 as a ground phase item, or it may be in conjunction with an annual FE evaluation annotated on the AF Form 8.

12.6.1. **(MACDILLAFB)** Taxi Certification. The 6 OG does not currently require FEs to be taxi certified. Should needs of the mission change, FEs will receive training and certification in accordance with AFI 11-218 and AMC Supplement.

12.6.2. **(MACDILLAFB)** Engine Run Certification. The 6 OG does not currently require FEs to be engine run certified. Should needs of the mission change, FEs will receive training and certification in accordance with AFI 11-218 and AMC Supplement.

12.6.1.1. Limitations. FEs are only authorized to taxi the aircraft with another taxi qualified crew member in the other seat. FEs are only authorized to taxi across runways at home station with a qualified pilot in the other seat (not applicable to PAG operations).

12.6.1.1.1. The conditions for taxi must be no worse than wet RCR and at least 1200 RVR (1/4 mile visibility).

12.6.2. Engine Run Certification. FEs are authorized instruction from a qualified instructor/examiner pilot or certified FE on engine run procedures IAW the FCM, AFI 11-218, MAJCOM Supplement, and local directives at the discretion of the unit commander. Training will be documented on the appropriate Aircrew Qualification Training Record. Initial and recurring engine-run certification will be documented on an AF Form 8 as a ground phase item. Not applicable to taxi qualified FEs.

12.7. Pushback Operations. The FE (or FCC as applicable) will normally be on headset for all pushback operations away from home station. All pushback/towing operations performed enroute by C-20/C-37 aircrews will be IAW AFI 11-218, unit OG/OGV approved checklist inserts and the FCM.

12.8. Local TOLD Card. The FE will complete the entire TOLD card, including the landing portion, prior to departure. FEs will confirm accuracy of (C-20/C-37) FMS computed performance data and complete manual TOLD card when required by the FCM or directed by the PIC.

12.8. (MACDILLAFB) Local TOLD Card. FEs will use a current version of AFMATIC (or manually generated TOLD data), based on current airfield conditions, to verify FMS TOLD prior to departure. This data will be readily available to either pilot should it be requested.

12.9. Multiple Full-Stop Landings. For all practice, full-stop landings, the FE will complete a new TOLD card using actual gross weight, field, and weather conditions. FEs will confirm accuracy of (C-20/C-37) FMS computed performance data and complete manual TOLD card when required by the FCM or directed by the PIC.

12.10. Monitoring Primary Radios. The FE will monitor the primary radio for flight clearances, altitudes, heading changes, and radio frequencies. The FE is not required to copy departure clearances.

12.10.1. For local sorties without a CSO onboard, the FE will monitor the local C2 frequency and report take-off times, block times and aircraft status as applicable.

12.10.2. For local sorties on the alert aircraft without a CSO onboard, the FE will monitor the local C2 frequency and report when transiting from each location as applicable.

12.11. Use of Second Flight Engineers. For VC-25 operations, a qualified second FE may perform exterior pre-flight duties without supervision. When supervised by an instructor or flight examiner FE, a second FE may occupy the FE position during takeoff and landing. The second FE does not need direct supervision by a flight examiner or instructor during climb, cruise, and descent at altitudes above 10,000 feet.

12.11.1. An FF may fly C-20/C-37 local training sorties provided they are current and qualified (valid AF Form 8), and they have received a local area orientation briefing from an instructor or evaluator FE. An FF may preflight a back-up aircraft provided a MF will fly the mission. An FF will not fly as a member of a basic crew except on local training missions.

12.11.1. **(MACDILLAFB)** All 310 AS local training flights will include an FE.

Chapter 13

FLIGHT ATTENDANT (FA) PROCEDURES

13.1. General. This chapter outlines procedures for FA not in the FCM or elsewhere in this volume.

13.2. Responsibilities. The FA is the direct contact between the USAF and the passenger. The FA primary duties are to instruct passengers in the use of emergency equipment, ensure cabin discipline and conduct emergency egress when necessary. Additionally, FAs act as the PIC's cabin representative, provide cabin service and maintain cabin cleanliness throughout the mission. On multi-FA crews, the first FA acts as FA supervisor and delegates specific duties and responsibilities to each FA. At home station, one or two FAs may be required to assist with post mission aircraft cleanup. Upon completion of missions, maintenance personnel should allow FAs one hour (C-9, C-20, C-37, C-40) or two hours (C-32) of uninterrupted time to clean aircraft.

13.3. FA Standards.

13.3.1. When making contact with party, FAs must wear appropriate uniform as prescribed in local supplement. Ensure accuracy of requirements and security of funds.

13.3.1. **(MACDILLAFB)** Flight Attendant uniforms will be in accordance with 310 AS OIs.

13.3.2. Any FA approaching VIP Aircraft on the DV spot/row should be in the appropriate uniform. This does not apply to cleaning crews, who should not approach the aircraft until all passengers and their baggage have departed the area.

13.3.3. Any problems encountered with passengers during the mission (i.e. mistreating the aircraft, disorderly behavior, etc.) will be forwarded to the PIC for appropriate action.

13.4. Pre-mission Duties.

13.4.1. Contact the PIC or navigator for draft itinerary times and any information already received concerning cabin service requirements. Provide en route mission ice requirements at this time.

13.4.2. Call or visit the mission contact officer to determine cabin service (food, beverage, catering etc.) requirements. Coordinate with CSO any estimated costs for communication services. It is vital that the contact understands all the associated cost for in-flight service may include communication services. See local supplement for billing procedures. For cabin food services, get the name of the onboard contact and obtain funds, if available (if not received from the mission contact, obtain funds from the In-flight Funds Custodian). Complete all portions of AF Form 4084, *Mission Planning Worksheet*. Procure needed supplies (food, beverages, special requirements, etc.) and retain all receipts.

13.4.2. **(MACDILLAFB)** FAs will not contact the DV mission contact until the mission is confirmed.

13.4.2.1. **(Added-MACDILLAFB)** Passenger Billing. Prior to mission completion, the FA will present the on board contact with the completed AF 4085, *Mission Expense*

Record, reviewed and signed by the AC, with receipts attached. The contact will sign in designated area and return to FA with any money owed. FA will make one copy to file with the mission package and return the original copy with receipts to the contact.

13.4.2.2. **(Added-MACDILLAFB)** Crew Billing. A separate AF Form 4085, with separate receipts, will be filled out for crew meals and presented to the AC for review and signature. This form will be filed with attached receipts with the mission package.

13.4.2.3. **(Added-MACDILLAFB)** The 310 AS may elect to impose a surcharge on the passenger and/or crew AF Forms 4085 to recoup In-flight Fund expenditures or losses due to DV party cancellations and changes.

13.4.3. The first FA on C-9, C-32, C-40 and VC-25 aircraft will conduct a FA briefing to assign FA positions and duties. For unplanned emergencies, all FAs will act in the position they are assigned. In planned emergencies, the FA with the highest qualification will assume command of the emergency and all FAs. It is critical that coordination between PIC and first FA occur during pre-flight briefings to assure that clear directions for action be defined for aircrew duties for planned and unplanned emergencies. This includes, but is not limited to: egress, cabin smoke, fire, and emergency passenger handling duties.

13.5. Preflight Duties.

13.5.1. Perform applicable preflight or en route checklists. On multi-FA aircraft, this preflight may be accomplished by one FA or divided into zones, as necessary. Check that applicable passenger information cards are properly distributed.

13.5.2. Upload food and fleet items and stow as necessary. If aircraft availability and maintenance scheduling allows, consideration should be given to loading non-perishable items the day prior to departure.

13.5.3. Prepare meals as required. Focus of preflight duties will be directed toward passenger service to ensure completion prior to station time and not inhibited by crew meal service.

13.5.4. Coordinate receipt of passenger manifests.

13.5.5. Coordinate passenger baggage loading and security. If loading space-available passengers at a non-US military facility, perform the following anti-hijacking inspections as directed by the PIC:

13.5.5.1. Check for proper identification and document passengers on DD Form 2131, *Passenger Manifest*.

13.5.5.2. Inspect baggage in an area well away from the aircraft.

13.5.5.3. Load baggage to prohibit in-flight passenger access (except for carry-on baggage).

13.5.5.4. Inspect carry-on baggage prior to boarding passengers.

13.5.6. Coordinate passenger loading. Accomplish passenger briefing, if required.

13.6. Passenger Handling.

13.6.1. Coordinate with the PIC before answering questions about the mission.

13.6.2. Do not unduly alarm passengers by relaying details of abnormal conditions not readily discernible by passengers.

13.6.3. Keep the PIC informed of all passenger problems, unusual requests, etc.

13.7. Border Clearance. Certain forms for border clearance are required by customs, immigration, public health and agriculture. The FA is the custodian for these and other required forms and will ensure adequate quantities are aboard the aircraft prior to takeoff. The first FA should be familiar with the FCG and AMC Border Clearance Guide requirements for applicable destinations and will distribute forms to the crew and passengers, as necessary, for completion prior to landing. Ascertain paperwork is forwarded to applicable personnel at en route and terminating stations.

13.8. En Route and Post Flight Duties.

13.8.1. FAs will provide cabin and meal service while maintaining the highest standards of safety and cabin discipline. During periods of in-flight turbulence (or when directed by the PIC) ensure all loose items are stowed and cabin service is suspended, if necessary.

13.8.2. Attend to flight crew needs when passenger service duties permit.

13.8.3. Complete applicable border clearance requirements and forms.

13.8.4. Assist with passenger deplaning and baggage offload or transfer. Ensure passengers do not leave required baggage unattended around aircraft or personal items left on the aircraft.

13.8.4.1. All passenger top-side baggage will be downloaded prior to cleaning aircraft.

13.8.5. FAs are responsible for aircraft cleanliness. They are also responsible for ensuring that all food items are properly stored and aircraft is ready before departing for over-night stops. All perishable items not used will be disposed of in appropriate trash containers and removed from the aircraft prior to leaving the aircraft. Follow host nation rules IAW FCG and border clearance guide. Unit policy should ensure the passenger cabin, galley(s) and lavatories are cleaned. Blankets and pillowcases should be changed (if needed) at en-route stops and upon return to home station.

13.8.6. Arrange or procure food and beverages required for subsequent mission legs. When purchasing wet/dry ice from vendors who will not accept an AF Form 15 or credit card, obtain funds from the PIC (or designated representative) and provide him/her with a receipt. The transportation officer will submit a SF 1164, *Claim for Reimbursement for Expenditures on Official Business*.

13.8.7. Under no circumstances will either perishable or non-perishable items purchased for the official party be consumed by crewmembers or ground support personnel, or taken from the airplane for personal use.

13.9. Forms.

13.9.1. AF Form 4084, *Mission Planning Worksheet*. Use this form to assist the FA in organizing passenger service requirements. The reverse of the form is a checklist to help inventory mission supplies. Record details received from the contact officer on the front of the form. Use the reverse as a pre-mission and preflight checklist. Individual unit may overprint unique requirements on this form.

13.9.2. AF Form 4085, *Mission Expense Record*. Use this form to record all expenses related to mission requirements. On each mission, separate copies of the AF Form 4085 will be maintained for passenger and crew meals/special requests. Ensure receipts are separated and retained for mission contact/PIC review. If unable to get a receipt from a vendor, prepare an itemized list of purchases and sign and date it. Upon mission completion, if the contact does not want leftover items, follow squadron policy for disposal (e.g. charity, etc.).

Chapter 14

COMMUNICATION SYSTEMS OPERATOR (CSO) PROCEDURES

14.1. General. This chapter outlines procedures for CSOs not in the FCM, other Air Force directives, or elsewhere in this volume.

14.2. Responsibilities. CSO is responsible for inspecting, operating, and maintaining all communications and electronic equipment aboard the aircraft while on a mission. Monitor and safeguard all classified material. Only CSOs are authorized access to the aircraft safe.

14.2.1. Assure communications resources are available to meet the DV party's communication requirements.

14.2.2. Assure adequate communications and electronic spare parts are available to support the mission.

14.2.3. Distribute message traffic aboard the aircraft. CSOs will not serve as a courier for classified message traffic received during ground operations.

14.2.4. **(Added-MACDILLAFB)** Communications System Billing. The 6 OG Resource Advisor in conjunction with 310 AS/DOC (CSO Flight) handles all communications services billing for C-37A missions.

14.3. Pre-Mission Procedures.

14.3.1. Review planned mission itinerary for mission profile and coordinate with the user's communications agency to determine mission communication requirements. Following coordination with the user's communications agency, contact the GNOC, if applicable, to ensure ground communications infrastructure is operational and properly configured to support user requirements.

14.3.2. Determine spare communications and electronic equipment requirements and arrange procurement.

14.3.3. Determine crypto kit requirements and advise squadron COMSEC account custodian. Arrange with the PIC if special arrangements must be made to safeguard COMSEC material during a mission.

14.3.4. Notify SOC of all special communication system support requirements, particularly if the special request was denied by a support agency. SOC will coordinate availability with MAJCOM tasking authority and applicable agencies.

14.3.5. Review applicable FLIP and the FCG to determine if there is any special communication reporting during en route travel or on arrival into all destinations.

14.3.6. When HFGCS VIP support is required, the CSO will ensure appropriate agencies are notified.

14.4. Pre-Flight Procedures.

14.4.1. Pick-up or arrange delivery of crypto kits.

14.4.2. Accomplish preflight inspections according to the FCM and COMSEC checklist.

14.4.3. Advise using and/or supporting agencies of aircraft communication status, i.e. limitations, available circuits, the need to report all communications problems to the CSO, etc.

14.4.4. Obtain a passenger manifest. Ensure the manifest is accurate for each leg of the mission.

14.4.4.1. **(Added-MACDILLAFB)** FAs will prepare a manifest to cover the entire trip and update the manifest as required. In all cases, the aircraft commander will ensure the CSO transmits passenger manifests to MacDill Command Post prior to aircraft departure. Copies of passenger manifests should not be distributed. Do not release names of the official party. If the information is requested, have the agency contact 310 AS/SOC. If space available passengers are carried, local air terminal personnel should prepare a manifest. Space available passengers will not be listed on the manifest for the official party.

14.5. In-Flight Procedures.

14.5.1. Maintain continuous phone patch capability and data circuit capability, as required. All circuits available for the mission will be monitored at all times.

14.5.1.1. The GNOC is the single POC for all passenger related communications issues. The GNOC will coordinate troubleshooting of all communications outages and problems with government and commercial service providers and notify applicable DoD agencies of the problems. CSOs will report all communications problems to the GNOC in a timely manner and IAW local procedures.

14.5.2. Transmit departure and arrival reports and other C2 communications as directed by the PIC.

14.5.2.1. The unit CP is the single POC for reporting all arrival and departure information for all VIP Missions. For USAFE, the AMD is the single POC. The local CP and some ground support agencies may require certain departure and arrival information items to keep track of their DV locations.

14.5.2.1.1. Departure and Arrival Messages. Refer to local supplement for specific message content. As a minimum, the message will contain the call sign, the time of block departure, Estimated Time of Block-in/Block-out (ETB) to next station, maintenance status, DV code, total number of official passengers, total "space A" passengers, and if applicable, the reason for a late takeoff/block-in. Request customs, agriculture, and immigration if needed.

14.5.2.1.1. **(MACDILLAFB)** Departure and Arrival Messages. Message content will be in accordance with AFI 11-2VIPV3, [paragraph 14.5.2.1.1](#). Additional message content will be in accordance with aircraft commander guidance.

14.5.2.2. Two Hour Out Report. A two hour out report will be sent to the next destination to update them of the DV's arrival time. All requests for aircraft servicing and any other special requests should be made at this time.

14.5.3. Transmit HF oceanic position reports if directed by the PIC and provide timely and accurate weather reports during the mission.

14.5.4. Relay DV messages and arrange passenger phone patch service, as required. Brief passengers on phone patch procedures. Advise passengers what type of circuit their phone patch is being placed over i.e. "Secure" or "NonSecure", and that the circuits are subject to monitoring.

14.5.5. Receive and distribute message traffic. All message traffic and requests will be delivered to passengers immediately after receipt. Ensure classified messages are stamped with applicable markings and note any special delivery instructions. Recipients must sign for all Top Secret messages.

14.5.6. Comply with local directives concerning disposition of messages, files, and logs. If they are records, ensure the dispositions are consistent with the Air Force Records Disposition Schedule.

14.6. En Route Security of Classified Material.

14.6.1. When RAVENs are carried; any level of classified material may be left onboard the aircraft in locked safes/security containers.

14.6.2. When RAVENs are not carried, after each flight and before departing aircraft, zeroize all COMSEC equipment. All superseded keying material will be destroyed. For all missions, place all classified keying material in a National Security Agency (NSA) approved sealable bag (computer disks will be placed in an anti-static bag before they are placed in the bag). After ensuring that the number on the strip matches the number on the bag, seal the bag and remove the strip for safekeeping. The sealable bag will be placed in the aircraft safe, which will be locked. Material will remain sealed and locked until the crew shows for the next flight.

14.6.3. The aircraft will be sealed (locked) and/or the alarm system activated (assuming no ASNCOs accompanied the aircraft) for all missions carrying classified material.

14.6.4. Upon arrival at aircraft and before each flight, the aircraft, security container, security bag and contents must be checked for signs of tampering or penetration. Match the serial number on the security bag with the serial number on the strip. Check security bag for any cuts, rips, discoloration or other abnormalities. Inventory or destroy (as necessary) all COMSEC materials. If any violation of the aircraft safe or its contents has taken place, or if the inventory shows discrepancies, you will assume a compromise has taken place. If this occurs, immediately contact CP and COMSEC account custodian by secure means if possible. Advise them of the situation and the mission impact. If a secure means is unavailable, identify to the COMSEC account custodian the affected line items from SF 153, *COMSEC Material Report* in question. They will advise the controlling agency. The COMSEC account custodian will advise you as to the disposition of the material and what actions to take with it.

14.6.5. US military guards not assigned to the VIP Aircraft may be treated as security guard status after their credentials have been verified. Foreign military/civilian guards fall into several categories. Current Operations and SOC will provide guidance on each situation. The aircraft will always be sealed (locked) and/or alarmed any time guards not assigned to the VIP Aircraft are used to guard the aircraft.

14.6.6. Securing Passenger Classified Material. Prior to leaving an aircraft, the CSO and FA will conduct a walk through of passenger compartments. During a mission, if classified documents are visible, secure the documents in the aircraft safe/security container and leave the passenger a note. If the documents exceed the safe's capacity, safeguard the documents, then attempt to contact the party and find adequate storage. When returning to home station at the end of a mission if classified documents are left on the aircraft by a passenger, work with the home station CP to have the classified documents returned to the passenger (do not release classified to uncleared personnel).

14.6.7. Simultaneous securing of weapons, cash and COMSEC is authorized in the aircraft safe if no other option is available.

14.7. Post Flight Procedures.

14.7.1. Accomplish postflight inspections including the FCM and COMSEC checklists.

14.7.2. Secure all classified materials and equipment. Put all classified waste in a burn bag marked with the highest classification, handling instructions, and mission number.

14.8. Post Mission Procedures.

14.8.1. Attend aircrew debrief as required.

14.8.2. Turn-in crypto kits.

14.8.3. Debrief communication systems operator superintendent and other applicable agencies.

14.8.4. Forward all communications problem logs, communications reports, and customer comment cards to the GNOC, MAJCOM/A6 and AMC/A6NG.

14.9. Destruction of Classified Material.

14.9.1. COMSEC Material Destruction. Any reliable DoD member may act as the witnessing official regardless of the individual's security clearance. If the witnessing official does not have the required clearance, allow the individual to see only the short title of the document/keylist being destroyed. COMSEC kits will be updated IAW security directives throughout the mission.

14.10. Information Assurance (IA).

14.10.1. This policy applies controls for all operations, maintenance, and logistics support activities associated with the classified/unclassified information systems and Local Area Networks (LAN) onboard the VIP fleet. The aircraft LANs provide customer access to secure/non-secure home domains and networks. The subsequent paragraphs detail the responsibilities of all organizations responsible for IA on the VIP fleet.

14.10.2. Aircraft information system users are the first line of defense in maintaining a vigilant IA posture. Users are afforded access to VIP Aircraft information systems/networks based on need-to-know, security clearance, and qualifications. VIP Aircraft information systems users are required to:

14.10.2.1. Protect system information, user identifications, passwords and network resources according to established AF and DoD regulations.

14.10.2.2. Disconnect any portable electronic device and report system security incidents, classified message incidents, vulnerabilities, and virus attacks to the aircraft CSO or Data Systems Operator (DSO).

14.10.2.3. Ensure any portable electronic device (ie., laptop, PDA, etc.) is compliant with home agency software patch levels and antivirus definitions.

14.10.2.4. Maintain current antivirus software on their portable electronic devices IAW AFI 33-200, *Information Assurance (IA) Management*, paragraph 3.27, and obtain CSO/DSO approval before disabling or changing the approved antivirus software.

14.10.2.5. Users will complete a full antivirus system scan of their computers just prior to connection to the aircraft network systems.

14.10.2.6. Ensure they do not use non-standard software (i.e., Freeware, Shareware, public domain software, etc.) unless approved for use by their Designated Approval Authority (DAA).

14.10.3. The aircraft CSO/DSO are the second line of defense in maintaining a strong IA posture. They are also in a unique position as being the only interface with the user to advocate IA policies and regulations. Additionally, the CSO/DSO is the liaison between the user and the Information Systems Security Officer (ISSO). To aid the ISSO and ensure proper IA, the CSO/DSO will:

14.10.3.1. Report system security incidents, classified message incidents, vulnerabilities, and virus attacks to the ISSO and the Andrews AFB GNOC.

14.10.3.2. Ensure users are aware that they are not allowed to use non-standard software (i.e. Freeware, Shareware, public domain software, etc.) while connected to an aircraft system unless approved for use by their DAA.

14.10.4. The GNOC is the last line of defense between the VIP airborne networks and the DISN. GNOC personnel provide 24/7 support to the VIP fleet and serve as the single POC for IA issues. The Andrews AFB GNOC will:

14.10.4.1. Monitor network traffic (inbound/outbound utilizing sensors).

14.10.4.2. Report system security incidents, classified message incidents, vulnerabilities, and virus attacks to the AMC NOSC.

14.10.4.3. Ensure latest antivirus signatures are loaded on all ground infrastructure equipment and available to the CSO/DSO and aircraft information systems users for updates.

14.10.4.4. Perform ground infrastructure system scans when malicious logic activity is detected/reported.

14.10.4.5. Ensure infected system(s) are taken off-line (Ground/Air Infrastructure).

14.10.4.6. Ensure Firewall protections/configurations are current (based on Ports/Protocols list or as directed by the AMC NOSC).

14.10.4.7. Provide CSOs/DSOs information on latest virus definitions and AF/DoD Information Assurance policies/instructions/regulations.

14.10.4.8. Additional roles and responsibilities for the GNOC can be found in the EACN CONOPS and local directives.

Chapter 15

AIRCRAFT SECURITY (RAVEN) PROCEDURES

15.1. General. This chapter outlines aircrew responsibilities and procedures for aircraft security NCOs (RAVENs) assigned to VIP missions. On missions, they are under the authority of the PIC. The RAVEN NCOIC will be pre-designated and will supervise the other RAVENs during the mission.

15.2. Responsibilities. RAVENs protect Presidential, Presidential Support, and certain other VIP missions and associated equipment according to AFI 31-101, 31-104V1, AFJI 31-102, *Physical Security* and Chapter 7 of this AFI. RAVENs are responsible to the PIC, who approves and coordinates any authorized deviations from the procedures in AFI 31-101, 31-104, and AFJI 31-102. RAVENs coordinate aircraft security protection with local military and civilian authorities. Assure local security efforts are smoothly integrated into the total security system to protect the aircraft. WG/CCs may authorize the use of augmentees to RAVEN teams.

15.3. Premission Procedures. All RAVENs will attend the PIC's aircrew briefing, when applicable. **EXCEPTION:** When RAVENs are not collocated, ensure the RAVEN NCOIC is verbally briefed by the PIC on the day the aircrew brief is held and that the entire RAVEN team is briefed by the PIC on the day of departure. The RAVEN NCOIC briefs his team on mission requirements, threat analysis, and specific duty assignments for the mission. The RAVEN NCOIC contacts the PIC when notified of the mission and assists in coordinating advance security support at en route destinations as required.

15.4. Preflight Procedures. RAVENs will arm themselves and will normally report to the aircraft not later than 2 hours prior to scheduled departure time.

15.4.1. Security Check. Conduct a complete security check of the aircraft, inside and outside. Assume sentry positions as directed by the RAVEN NCOIC.

15.4.2. Mission Information. The RAVEN NCOIC is responsible for obtaining passenger manifests and crew orders, mission itinerary cards, en route stop cards, and the AF Form 1109, *Visitor Register Log*.

15.4.3. Aircraft Access Control. Personnel listed on the applicable unescorted entry list or the passenger manifest will be granted unescorted entry on the aircraft. Manifest changes for Presidential aircraft must be approved by the duty military aide to the President. Manifest changes for Presidential Support aircraft are approved by the PIC. Manifest changes for all other aircraft are approved by the mission contact officer or PIC. RAVENs board the aircraft only after all passengers and other aircrew members have boarded.

15.4.4. Baggage Control. One RAVEN will be positioned as a sentry at the baggage compartment until all baggage is loaded and the compartment is secured. Assure all baggage is properly identified. Cross-check baggage labels against the passenger manifest.

15.5. In-Flight Procedures. Report all security problems to the PIC. When the aircraft is transporting space available passengers, the RAVEN NCOIC assigns team members (if required) to occupy seats in each passenger compartment where passengers are seated. Don't allow passengers to have access to their stowed baggage in-flight.

15.6. Post-Flight Procedures. When the aircraft blocks in, RAVENs deplane first. Take up pre-designated positions fore and aft of the aircraft. When the baggage compartment is opened, one RAVEN monitors baggage unloading and remains as a sentry until the baggage compartment is secured. If crew baggage will be out of crewmember's control, (e.g. clearing customs) a RAVEN will accompany the baggage at all times. If using secured fuel supplies, one RAVEN checks the numbered seals against the documents provided by the mission contact officer or advance agent.

15.6.1. Local Security. If local security forces will augment RAVENs during ground times, the RAVEN NCOIC will brief them on their duties and responsibilities.

15.6.2. Miscellaneous. At least one RAVEN will always be stationed as primary sentry at all times. Presidential, Presidential Support, and certain other VIP missions protected by RAVENs are not sealed. The RAVEN NCOIC schedules RAVENs for sentry duty.

15.7. Post Mission Procedures.

15.7.1. Continued Security Protection. If the aircraft is Presidential, Presidential Support or if the aircraft is to maintain upgraded security status, the RAVEN will maintain security protection until relieved by appropriately cleared military sentries.

15.7.2. Terminating Security Protection. If the aircraft security status is to be terminated, RAVENs remain at the aircraft until all passengers and baggage are unloaded and the PIC terminates the upgraded security status according to AFI 31-101.

15.7.3. After Termination. When relieved, turn in weapons and ammunition to the armory. Comply with local debriefing requirements. The RAVEN NCOIC turns in the completed AF Form 1109, *Visitor Register Log*.

15.8. AF Form 1109, Visitor Register Log. Consult local directives concerning completion and authentication procedures for this form.

Chapter 16

FLYING CREW CHIEF (FCC) PROCEDURES

16.1. General. This chapter outlines duties and responsibilities of aircraft crew chiefs. Normally, only C-9, C-32, C-40 and VC-25 crew chiefs fly with their aircraft on all missions. Crew chiefs can be scheduled to fly on other aircraft as directed by the WG/CC. The maintenance organization coordinates with appropriate agency (SOC or equivalent) to schedule crew chiefs to each mission. Manning requirements are IAW chapter 3 of this AFI. The crew chief will be listed on the flight authorization.

16.2. Responsibilities. The crew chief is the primary aircraft mechanic and performs maintenance to maintain a mission-ready aircraft status. After reporting for a mission, the crew chief is responsible to the PIC or EAC (as appropriate to their MDS). As a minimum, the crew chief shall:

- 16.2.1. Perform or assist aircraft servicing at all stations.
- 16.2.2. Accomplish preflight, thru-flight and post-flight inspections per TO 00-20-1 and applicable supplements. Assist flight engineers during preflight, as needed.
- 16.2.3. Manage the aircraft's en route mission support kit (MSK) and log.
- 16.2.4. Perform maintenance at en route stations.
- 16.2.5. Perform aircraft block-out and block-in procedures.
- 16.2.6. Ensure inventory of life support equipment and dash-21 equipment is accomplished, as the PIC's representative.
- 16.2.7. Maintain the AFTO 781 series. Inform EAC or PIC of all maintenance discrepancies entered in AFTO 781A.
- 16.2.8. Be responsible for the DD Form 1896 and Multi Service Card.
- 16.2.9. Be responsible for AF Form 15 and handle all aircraft related payments on aircraft.
- 16.2.10. Ensure EROPS maintenance procedures and servicing are accomplished on EROPS capable aircraft.
- 16.2.11. Ensure EROPS maintenance release is properly signed off prior to each flight for EROPS capable aircraft.
 - 16.2.11.1. For C-32 and C-40 aircraft, ensure appropriate home station maintenance is updated with aircraft status after each leg (if possible).

16.3. Procedures. Attend the PIC's pre-mission aircrew briefing. Brief the flight engineers or PIC on status of the aircraft, recent maintenance history, and MSK concerns. Discuss requirements for aerospace ground equipment (AGE) and servicing requirements needed at each stop. Confirm aircraft configuration.

- 16.3.1. For All Departures. Assure the required fuel load, as briefed by the PIC, is aboard. Ensure completion of the pre-departure checklist (if applicable) and all required MSK items are aboard aircraft. Aircraft positioning will be accomplished by taxiing aircraft with qualified aircrew members or by towing aircraft by maintenance support personnel to

terminal or DV spot when required. Ensure required AGE is available and connect to aircraft as required. Assist in placing boarding steps or ramps in position and removal when tasks are complete. Ensure AFTO forms are properly completed. Assist aircraft baggage/cargo loading to ensure weight and balance criteria is properly maintained. Report any deviations to PIC (required on C-40).

16.3.2. In-flight Duties. FCCs will not perform in flight duties/maintenance unless in the opinion of the PIC an emergency condition exists requiring FCC's assistance.

16.3.3. For All Arrivals (Intermediate or Overnight). Perform scanner duties outside of the aircraft (as required) during ground operations as required by the PIC. Extend aircraft stairs (if applicable). Deplane before DV and passengers (with the flight engineer if applicable). Assist in positioning boarding steps and ramps. Ensure aircraft is safely blocked-in. Coordinate necessary ground support and equipment for departure and servicing procedures. Accomplish all servicing (if applicable to MDS) and perform required maintenance. Perform any required inspections. Ensure required AGE is available for departure.

16.3.3.1. For Overnight Stops. Accomplish post-flight inspections. Perform or assist all servicing operations. Install required FOD/dust covers and plugs IAW the FCM.

16.3.4. If Maintenance Is Required. When aircraft parts are required, use available MSK parts to the maximum extent possible. Coordinate with PIC or EAC before ordering or purchasing parts from available sources. Always determine the applicable part number through the Illustrated Parts Catalog, or contracted servicing partner prior to ordering and/or purchasing parts. Coordinate with the PIC to determine delivery location for all shipped parts. Ensure home station maintenance is informed and can aid in coordination for parts. Advise unit C2 (CP or AMD) of estimated ETIC for dispatch release. Typically, ETIC = parts delivery time to aircraft + job completion time. Communicate this time to PIC when able.

16.3.5. On Return to Home Station. Comply with local debriefing requirements. Replace (or back order) any used MSK items. Turn in all AF Form 15 and AF Form 664 to unit resource manager.

16.4. Authority to Clear Red X Symbols in the AFTO 781A. IAW TO 00-20-1, when authorized by the home station maintenance group commander and CLS agreement, certified FCCs are authorized to clear red X write-ups.

Chapter 17

FUEL PLANNING

17.1. Fuel Requirements. This paragraph implements standard minimum fuel requirements and will be used in conjunction with procedures established in the applicable FCMs.

17.2. General. As a minimum, required ramp fuel will consist of all fuel required for engine start, taxi, warm-up, APU operation, takeoff, climb, cruise, en route reserves (if required), alternate/approach/missed approach (if required), descent, approach, and landing.

17.3. Reserve Fuel Planning. Plan a 45-minute fuel reserve at destination or alternate (when an alternate is required).

17.3.1. Reserve fuel will be computed using consumption rates providing maximum endurance at 10,000 feet MSL at destination gross weight. If an alternate is required, compute using weight at alternate destination. When computing reserve fuel for remote destinations, use consumption rates providing maximum endurance at 20,000 feet MSL.

17.3.2. En route reserve fuel. Compute using 10% of the flight time fuel over Class II airspace, not to exceed 1 hour at normal cruise OR contingency fuel as designated on commercially dispatched flight plans.

17.4. Alternate Fuel Planning. If required, plan fuel to an alternate IAW AFI 11-202V3 and chapter 6 of this regulation.

17.4.1. If two alternates are required, compute fuel from destination to most distant alternate.

17.4.2. For remote destinations, holding is authorized in lieu of an alternate airport. In such situations, use 2+00 reserve fuel (1+15 holding in lieu of an alternate and 0+45 fuel reserve IAW 17.3.).

17.4.3. When determining fuel required for holding in lieu of an alternate, compute using holding tables at 20,000 feet MSL at destination gross weight.

17.5. Required Ramp Fuel for EROPS Capable Aircraft. Block to block fuel must be greater than or equal to: fuel required to fly to the ETP, experience a simultaneous engine failure and loss of cabin pressure, and proceed from the ETP to a recovery field at 10,000 feet or 13,000 feet (if sufficient crew oxygen is available) using single engine cruise procedures. If extra fuel is required, it will be added as identified extra. **NOTE:** If passengers are not onboard and all crew are equipped with supplemental oxygen, flight may be planned and flown using recovery from the ETP at Single Engine Service Ceiling (up to FL 250), instead of 10,000 feet.

17.6. Equal Time Points (ETPs).

17.6.1. If the flying time to a suitable alternate airfield exceeds 60 minutes, computed at 10,000 feet, single-engine cruise speed, in still air, from any point along the route of flight, computation of an ETP is required. ETPs may be computed by MAJCOM certified CFPs. Annotate it along the planned route of flight on the OPC/Global Navigation Chart.

17.6.2. Compute ETPs according to the following formula:

$$\text{FL100 ETP (nm)} = \underline{D \times \text{GSR}}, \text{ where:}$$

GSR+ GSC

D - distance in nautical miles between destination field and recovery field (not necessarily the departure field).

GSR - average ground speed to continue to return to a recovery field at 10,000 feet. To compute groundspeed, apply forecast headwind/tailwind component at 10,000 feet to true airspeed.

GSC - average ground speed to continue to destination at 10,000 feet.

EXAMPLE: D = 1040nm, 10,000 feet winds forecast 60 kt headwind to continue, 80 kt tailwind to return, TAS at 10,000 feet, Long Range Cruise (LRC), is 324 kts at std day, 86,000 lb gross wt.

$$\text{ETP} = \frac{(1040)(404)}{(404 + 264)} = 629 \text{ nm from the recovery base.}$$

NOTE: The computation above will yield an ETP based on recovering or continuing at 10,000 feet. This is the most limiting case, and will ensure an accurate ETP in the event of an emergency such as a rapid decompression.

17.7. Safety. PICs must ensure that all factors be considered when determining ramp fuel. For all aircraft, factor in payload and the risk involved in fuel planning over oceanic and mountainous regions and the resultant OEI performance capability during all phases of the flight. Consider fuel needed at ETPs and en route alternate suitability. Utilize EROPS planning, if applicable, to enable increased capability or safety in the event of emergency. Finally, consider weather patterns at the destination alternate. If it is too close to a poor weather destination, increase ramp fuel to provide a more suitable alternate.

17.8. Fuel Conservation. Aircrew and mission planners will manage aviation fuel as a limited commodity and precious resource. Fuel optimization will be considered throughout all phases of mission planning and execution. Excessive ramp and recovery fuel adds to aircraft gross weight and increases fuel consumption. Do not ferry extra fuel beyond optimum requirements for safe mission accomplishment and training objectives. Aircrew and mission planners will optimize flight plans and flight routing for fuel efficiency. In-flight procedures such as climb/descent profiles and power settings should also be considered for efficient fuel usage. Aircrew should employ the following aviation fuel optimization measures without compromising flight safety or jeopardizing mission/training accomplishment:

17.8.1. Use optimized CFPs when possible. LRC and optimum altitude should be flown. Limit the use of the APU when possible. Delay engine start. Cruise Center of Gravity (CG) should be aft if practical. Fly en route descents when possible.

17.8.2. Normal cruise speeds are as follows: C-9/C-40: mach 0.78; C-20/C-32/C-37: mach 0.80; VC-25: mach 0.84. Use high speed cruise only when needed to satisfy the requirements of the DV. Do not exceed FAR or host nation aircraft speed restrictions.

17.8.3. Extra fuel (identified/unidentified) may be added to required ramp fuel load. Unidentified fuel allows crews some flexibility when dealing with unplanned contingencies (e.g., unreliable NAVAIDs, weather avoidance, ATC delays, etc.) and should be kept to a minimum. Do not carry extra fuel for convenience; roughly 3 percent of the excess will be burned each hour. Use the following guidelines when determining extra fuel requirements:

17.8.3.1. When fuel availability is limited or not available at en route stops.

17.8.3.2. When compressed ground times during single multi-day sortie missions preclude refueling at en route stops.

17.8.3.3. When en route refueling would delay or be detrimental to mission accomplishment.

17.8.3.4. For known holding delays in excess of standard.

17.8.3.5. For anticipated off course weather avoidance to include avoidance of forecast turbulence detrimental to passenger comfort.

17.8.3.6. If decompression with passengers would cause a descent to an unplanned altitude resulting in consumption in excess of planned fuel; add fuel to recover at a suitable alternate at the appropriate altitude.

17.8.3.7. To offset increased fuel consumption due to icing.

17.8.3.8. When destination NAVAIDs, ATC services, or landing aids are unreliable or insufficient.

17.9. Fuel Limitations. VIP Aircraft are not allowed to operate on JP-8+100 except in emergency conditions. If inadvertent refueling with JP-8+100 occurs, the aircraft will be immediately de-fueled prior to flight. All JP-8+100 locations are required to maintain a clean JP-8 capability to support transient aircraft. Every effort must be made not to allow aircraft flight while serviced with JP-8+100. If emergency refueling occurs utilizing JP-8+100, flight crews will make an AFTO 781 entry stating, “**CAUTION:** Aircraft refueled using JP-8+100, preventive measures must be taken when de-fueling. Close coordination with maintenance and POL fuels personnel must be accomplished.”

17.10. Aircraft Specific Fuel Planning. As a minimum, comply with AFI 11-202V3 fuel requirements and the following:

17.10.1. C-9.

17.10.1.1. Minimum fuel required upon landing at destination, or landing at alternate (if an alternate is required IAW AFI 11-202V3): 4,000 lbs. This includes the required reserve fuel IAW 17.3.

17.10.2. C-20.

17.10.2.1. APU, Start, Taxi, Takeoff Fuel: 500 lbs. (C-20B), 400 lbs. (C-20H).

17.10.2.2. Approach and Landing Fuel: 500 lbs.

17.10.2.3. Minimum fuel required upon landing at destination, or landing at alternate (if an alternate is required IAW AFI 11-202V3): 3,000 lbs. This includes the required reserve fuel IAW 17.3.

17.10.3. C-37.

17.10.3.1. APU, Start, Taxi, Takeoff Fuel: 500 lbs.

17.10.3.2. Approach and Landing Fuel: 500 lbs.

17.10.3.3. Minimum fuel required upon landing at destination, or landing at alternate (if an alternate is required IAW AFI 11-202V3): 3,000 lbs. This includes the required reserve fuel IAW 17.3.

17.10.4. VC-25.

17.10.4.1. APU, Start, Taxi, Takeoff Fuel: 2,000 lbs.

17.10.4.2. Alternate Fuel: 5,000 lbs. minimum.

17.10.4.3. Approach and Landing Fuel: 2,500 lbs.

17.10.4.4. Minimum fuel required upon landing at destination, or landing at alternate (if an alternate is required IAW AFI 11-202V3): Required fuel reserve IAW 17.3.

17.10.5. C-32.

17.10.5.1. APU, Start, Taxi, Takeoff Fuel: 900 lbs.

17.10.5.2. En Route Reserve Fuel: Normally use 1,500 lbs.

17.10.5.3. Alternate Fuel: 2,500 lbs. minimum.

17.10.5.4. Minimum fuel required upon landing at destination, or landing at alternate (if an alternate is required IAW AFI 11-202V3): 4,500 lbs. This includes the required reserve fuel IAW 17.3.

17.10.6. C-40.

17.10.6.1. APU, Start, Taxi, Takeoff Fuel: 600 lbs.

17.10.6.2. En Route Reserve Fuel: Normally use 3,000 lbs unless calculated to be a lower value based on actual time over Class II airspace.

17.10.6.3. Alternate Fuel: 2,500 lbs. minimum.

17.10.6.4. Minimum fuel required upon landing at destination, or landing at alternate (if an alternate is required IAW AFI 11-202V3): 3,800 lbs. This includes the required reserve fuel IAW 17.3.

Chapter 18

AIR REFUELING

18.1. Air Refueling (AR) Limitations. This chapter establishes guidelines applicable to VC-25 aircraft and aircrews, and is supplemental to those prescribed by the flight manual and other applicable directives. The PAG training for air refueling includes simulators and alternate USAF B-747 derivative aircraft. The use of Presidential Aircraft for air refueling training is at the Presidential pilots' discretion.

18.1.1. Refueling During Training Missions. AR should not be accomplished during training missions when:

18.1.1.1. Conditions are encountered that, in the opinion of the PIC, result in marginal control of either aircraft or the boom.

18.1.1.2. Either the tanker or the receiver has less than the full number of engines operating.

18.1.2. Tanker Autopilot. Tanker pilots must notify receiver pilots when any axis of the autopilot is not used. If the tanker copilot is required to fly autopilot-off for training, unqualified receiver pilots will not fly the aircraft. Tanker pilots must notify the receiver when copilot autopilot-off training is conducted and receive confirmation that the receiver pilot flying the aircraft is qualified.

18.1.3. AR Without Tanker Disconnect Capability. Without tanker disconnect capability means the boom operator cannot trigger an immediate disconnect. AR will not be conducted after a known loss of tanker disconnect capability. **EXCEPTION:** Fuel emergency situation. **NOTE:** When conducting AR without tanker automatic disconnect capability, limit contacts to the minimum number necessary to complete mission requirements. Do not accomplish boom limit demonstrations, or practice emergency separations while in the contact position.

18.1.4. Override Boom Latching. This is an emergency procedure. Tanker automatic disconnect limits and tanker normal and manual disconnect capability is inoperative. If approved, use of this procedure will be authorized in the mission directive. **NOTE:** Boom operator and receiver pilot must coordinate all actions as required by applicable directives and checklists when making AR contacts using emergency boom latching procedures.

18.1.5. Reverse AR procedures can be accomplished for operational necessity only.

18.1.6. Practice Emergency Separations:

18.1.6.1. Prior to the actual accomplishment of a practice emergency separation, coordination between the tanker pilot, boom operator, and receiver pilot is mandatory. Coordination must include when the separation will occur and who will give the command of execution. Tanker pilot coordination may be accomplished over interphone with the boom operator.

18.1.6.2. If separation is initiated from the contact position, the receiver's AR system must be in normal, and a boom operator disconnect capability with the receiver must exist.

18.1.6.3. Practice emergency separations will not be accomplished with passengers on board unless passengers are seated with seat belts fastened.

18.1.7. Receiver AR Training for Unqualified Receiver Pilots. (This includes copilots, AC upgrade candidates and ACs refueling from the right seat). In-flight training will be accomplished under direct IP supervision. The following procedures apply:

18.1.7.1. The receiver pilot must inform and receive acknowledgment from the tanker. The boom operator operating the boom controls must be qualified for the applicable category receiver. (This restriction does not apply during school house training provided the student boom operator is under direct instructor supervision.)

18.1.7.2. If the tanker autopilot is off, the tanker copilot will not fly the aircraft. (This restriction does not apply during school house training provided the student receiver pilot and the student tanker copilot are under direct IP supervision.)

18.1.7.3. For receiver pilot initial qualification or re-qualification, the receiver instructor/examiner pilot will be in one of the pilot seats with immediate access to the controls through all phases of the refueling from pre-contact until post air refueling.

18.1.8. If a change of pilot control is made, the receiver aircraft will move back to at least the pre-contact position except for immediate assumption of control by the instructor pilot.

18.1.9. If a receiver seat change takes place, move back to at least 100 feet in trail of the tanker and to a point where the receiver pilot can maintain visual contact with the tanker until the seat change is completed.

18.1.10. When conducting AR behind a KC-135, tanker disconnect capability must be demonstrated by a boom operator initiated disconnect prior to conducting a limit demonstration or a practice emergency separation from the contact position.

18.1.11. Weather Limitations.

18.1.11.1. Turbulence: Do not launch if severe turbulence is forecast on the refueling track. Terminate refueling if moderate turbulence is encountered.

18.1.11.2. Visibility: Do not close from 1 NM range (2 NM for receiver or tanker cell formations) unless you have visual contact with the tankers. Discontinue refueling if in-flight visibility is insufficient to continue safe refueling operations.

18.1.11.3. Recovery airfield must meet the weather criteria of AFI 11-202V3 for alternate airports.

18.2. Not Used.

18.3. Not Used.

18.4. Not Used.

18.5. Receiver Aircraft Commander Responsibilities.

18.5.1. Receiver aircraft shall squawk normal when separation from the tanker is greater than 3 miles.

18.5.2. Receiver aircraft will maintain two-way radio contact with ATC until cleared to the aerial refueling block altitude and cleared to the AR frequency by ATC.

18.6. ATC Clearance.

18.6.1. Altitude Reservations (ALTRV). Air refueling operations normally are done on tracks or anchor areas published in the DoD FLIP. Certain missions or operational considerations may require air refueling operations in areas not published in FLIP in which an ALTRV is often used.

18.6.1.1. An ALTRV may include all, a portion, or portions of a published route. On operational missions, an ALTRV is usually provided for the refueling portions of the route. In some cases, an ALTRV is provided from the point of departure to a specified point short of the destination.

18.6.1.2. Aircraft operating on an ALTRV must operate within the altitude, time, and areas specified. Actual fix timing will not exceed 10 minutes from ALTRV estimates; otherwise the ALTRV will be canceled by ATC.

18.6.1.3. The mission must be airborne within a certain time period. The end of this period is the assigned ALTRV Void if Aircraft Not Airborne (AVANA) time. This ensures separation between aircraft. Unless otherwise specified, AVANA is 1 hour after ALTRV published departure time.

18.6.1.4. If a mission is delayed beyond AVANA, rescheduling normally is by 24-hour increments based on the original departure time. It may be less provided the Central Altitude Reservation Facility and affected ATC agencies concur.

18.6.1.5. An ALTRV does not preclude ATC from using ALTRV airspace provided standard separation is applied between all aircraft.

18.6.2. ALTRV Format. See FAA 7610.4H, *Special Military Operations*.

18.6.3. Filing:

18.6.3.1. An ALTRV approval includes a complete description of the route, including altitudes to be flown. When filing a DD Form 175, you do not need to repeat this in the route of flight portion of the flight plan. When filing a DD Form 1801, this information is repeated in the route of flight portion. In either case, include the term ALTRV plus the nickname/code name of the ALTRV in the remarks section of the flight plan.

18.6.3.2. If the ALTRV is to a point short of destination, the route of flight after the ALTRV must be identified on the flight plan. To complete the route of flight portion of the flight plan, identify the ALTRV as before, immediately followed by end ALTRV coordinates or fix, and a subsequent route description.

18.7. Communications Failure. Aircraft experiencing two-way communications failure during the conduct of AR shall continue flight IAW the following procedures:

18.7.1. Squawk code 7600 for at least 2 minutes prior to exiting the track or anchor.

18.7.2. Aircraft that have not received altitude instructions beyond the exit point shall exit the track or anchor at the lowest altitude specified in the clearance for the refueling portion of the flight and proceed IAW "Procedures for Two Way Radio Failure IFR-VFR" set forth in the FIH.

18.8. MARSA (Military Assumes Responsibility for Separation of Aircraft)--Applicability for Aerial Refueling. MARSA begins between the tanker and receiver when the tanker advises ATC that it is accepting MARSA. MARSA is not an ICAO recognized term. If in doubt as to what separation is provided by ATC, or what separation the aircrew is responsible for, query the tanker and/or controlling agency.

18.8.1. If MARSA has not been accepted by the tanker before the receiver reaching the air refueling initial point (ARIP), the receiver may be required to hold at the ARIP.

18.8.2. Once the rendezvous is completed, headings and altitude assignments may be made with the tanker concurrence with MARSA remaining in effect.

18.8.3. Upon completion of the rendezvous, receiver aircraft will remain within 3 miles of the tanker until MARSA is terminated.

18.8.4. MARSA ends when normal separation standards are established, ATC accepts control at end of refueling and ATC advises "MARSA is terminated."

Chapter 19

TACTICAL EMPLOYMENT

NOTE: Certain technical information was intentionally omitted or generalized to keep this chapter unclassified. Users should be aware that written additions to any portion of this document could cause it to become classified.

19.1. General. Each unit will have a tactics ground training program tailored to the unit's combat taskings. Using a building block approach, the ground tactical training program forms the base of the unit's tactics program. Each unit's tactics ground training program may be different due to differences between unit mission taskings and MDS capabilities and equipment.

19.2. Responsibilities. The tactics ground training program will be a coordinated effort between unit tactics, intelligence, training, stan/eval and plans offices in order to ensure that continuity and the unit's specific mission taskings are addressed. The program is the responsibility of the squadron commander and is managed by the unit tactics officer.

19.2.1. Unit Tactics Officer. Responsible for the development, maintenance, and currency of the instructional materials used in the tactical training of aircrew. Responsible for ensuring motivated, informed, and credible instructors administer these materials. The tactics officer ensures the tactics training syllabus is comprehensive and covers all aforementioned topics. More importantly, it is his/her responsibility to teach and infuse tactics throughout the unit's operations. This is primarily accomplished by developing ground and flight training profiles to ensure aircrew members are trained in tactical mission planning and employment.

19.2.2. Tactics Library, Publications and Publicity. The unit tactics officer, with intelligence assistance, is responsible for developing tactics, techniques, and procedures for timely dissemination of tactical and intelligence information to unit aircrew members.

19.2.2.1. Tactics Library. The tactics library, unclassified and classified, is maintained by the unit tactics officer. Library contents are specified in appropriate MAJCOM supplements. AMC and AMC-gained crew will use AMCI 11-207, *AMC Weapons and Tactics Program*. This library provides comprehensive tactical reference and study material at the unit level. The most current MDS-specific AFTTP 3-1 and 3-3 must be part of the library. Each unit is encouraged to provide constructive updates to the AFTTPs and attend periodic AFTTP conferences. AMC/A3D will validate AFTTP changes/recommendations.

19.2.2.2. Tactics Publications.

19.2.2.2.1. Aircrew Tactics Guide. An Aircrew Tactical Guide/Tactical Flimsy should be developed by wing/group tactics. This in-flight guide should be unclassified and based primarily on MDS-specific AFTTPs. AMC Tactics (AMC/A3D), acting as lead MAJCOM, will validate all tactical guidance.

19.2.2.2.2. Combat Entry and Exit Checklists. As detailed in the MDS-specific AFTTP 3-3, Combat Entry and Exit Checklists should be checklist inserts for use on training and operational missions into simulated or actual threat environments.

Expanded Combat Entry and Exit Checklists with detailed explanations/instructions should be included in the Aircrew Tactics Guide for in-flight reference. In the absence of specific directives, the Combat Entry Checklist is initiated prior to entering the threat environment. The Combat Entry Point is determined by theater guidance or known/suspected weapons engagement zone (WEZ). In the absence of more specific directives, initiate this checklist no later than 30 minutes prior to entering the threat environment. If the aircraft will depart an airfield within a threat environment, or will enter the threat environment within 1 hour after takeoff, the checklist should be run prior to the line-up checklist. The Combat Exit Point is determined by theater OPORD/SPINS guidance or known/suspected WEZ.

19.2.2.3. Tactics Publicity. In order to disseminate current and relevant tactical information to crew members, the tactics office should create a variety of publicity sources. For example, the tactics office can create an unclassified and/or classified Tactics Read File, periodic tactics newsletter, AOR mission planning binders, etc. In addition, tactics should be periodically discussed at aircrew meetings, operations meetings, or commander calls. In addition to hosting the Tactics Review Board (TRB), the tactics office should be involved in unit/group/wing Stan/Eval Boards (SEBs) and Realistic Training Review Boards (RTRB).

19.3. Tactics Flight Training.

19.3.1. Scope. Tactics flight training will be based upon the maneuvers detailed in interim MAJCOM-released tactical employment supplements and, once formally published, on complete AFTTP 3-1/3-3 volumes. Due to the unique nature of VIP Missions, in-flight maneuvering should primarily emphasize exposure reduction (as a function of time and aircraft signature) in a threat environment. Finally, do not attempt any tactical maneuver that is not specifically mentioned in this publication without parent MAJCOM/A3 approval.

19.3.2. Objectives. The tactics flight training program is designed to provide VIP aircrews with the training necessary to confidently and successfully survive the combat threat environment without endangering aircrews or aircraft in peacetime. Simulators are the preferred medium for tactics training, but specific MDS tactics flight training syllabi may be comprised of aircraft-based training as well.

19.3.3. Tactical Maneuvers. In accordance with the more specific Maneuver Restrictions outlined in [paragraph 19.4](#) of this AFI, the following tactical maneuvers are authorized for training and operational employment:

Table 19.1. C-20/C-37 Approved Tactical Maneuvers.

Phase of Flight	Maneuver Name	AFTTP 3-3/C-20/37 Reference
Tactical Slowdown	Idle (with or without speed brakes)	7.7.1
Tactical Descent	Full Flap (flaps 39 degrees) Descent	7.7.3.1
Tactical Descent	Partial Flap (flaps 20 degrees) Descent	7.7.3.2
Tactical Descent	Flaps Up Descent	7.7.3.3

Tactical Approach	Hi-Speed Instrument Approaches (ILS)	7.4.3
Tactical Approach	Course Reversal	7.8.2.1
Tactical Approach	Abeam Approach	7.8.2.2
Tactical Approach	Curvilinear Approach	7.8.2.3
Tactical Go-Around	Low-Closed Pattern	7.9.3.2
Tactical Departure	Low Altitude High Speed Departure	7.11.2.1
Tactical Departure	Medium/High Altitude Departure	7.11.2.2
Tactical Departure	Straight Ahead Departure	7.11.2.3
Tactical Departure	Spiral Up Departure	7.11.2.4

Table 19.2. C-32/40 Approved Tactical Maneuvers.

Phase of Flight	Maneuver Name	AFTTP 3-3/C-32/40 Reference
Tactical Descent	Clean Descent	7.7.1, Tables 7.7 & 7.8
Tactical Descent	Configured Descent	7.7.2, Tables 7.7 & 7.8
Tactical Approach	C-32/40 Level Cruise Decelerations	Figs 7.1 & 7.2
Tactical Approach	C-32/40 Low Altitude Max Rate Decelerations	Figs 7.3 & 7.4
Tactical Approach	High Speed Instrument Approach	7.8.3, Fig 7.5
Tactical Approach	Medium Altitude Approaches	7.8.4, Fig 7.6
Tactical Approach	Course Reversal	7.8.5.1, Figs 7.8 & 7.9
Tactical Approach	Straight-in Approach	7.8.5.2, Fig 7.10
Tactical Approach	Abeam Approach	7.8.5.3, Fig 7.11
Tactical Departure	C-32/40 Tactical Departures	7.10

19.4. Maneuver Restrictions.

19.4.1. For operational missions, see [paragraph 5.4.1](#) of this AFI, regarding seat restrictions. Tactical maneuver training missions will include direct IP supervision with unqualified pilots (pilots gaining initial tactical certification) in the seat.

19.4.2. Passengers are not permitted when performing tactical maneuvers for training or currency. This restriction does not preclude performing tactical training maneuvers for currency or semi-annual training requirements on operational missions when no passengers are onboard (i.e. position/de-position legs).

19.4.3. All loose items aboard the aircraft will be secured prior to initiation of maneuver(s).

19.4.4. Crew must be fully briefed on all maneuvers. Consider notifying passengers prior to aggressive maneuvering on operational missions.

19.4.5. Complete combat entry/exit checklists and appropriate approach/departure checklists prior to initiation of maneuver(s).

19.4.6. Do not exceed aircraft operating or performance limits (thrust/speed/bank/configuration) at any time.

19.4.7. All low altitude departures must meet obstacle clearance criterion IAW paragraph 6.16 of this AFI. OG/CC or equivalent is waiver authority.

19.4.8. The final portion of all approaches will be stabilized. Stabilized is defined as on speed for configuration, gear down, on 3 degree glidepath and runway centerline. This stable platform must be established no later than ½ mile from runway threshold.

19.4.8.1. Initiate go-around if not stabilized for the approach.

19.4.9. Minimum weather for all operational and training tactical maneuvers is VMC.

19.4.10. Do not fly these tactical maneuvers for training at uncontrolled fields.

19.4.11. Ensure aircraft operations comply with all airspace rules unless waived.

19.4.11.1. During training, pre-coordinate procedures with local ATC any time tactical maneuvers will be accomplished. For frequent tactical training at a particular airfield, consider establishing a LOA. LOAs boost safety of flight and efficiency of maneuver by standardizing phraseology and dimensions for various tactical flight maneuvers between aircraft and controller.

19.5. Exercises.

19.5.1. Scope. Exercises provide realistic combat-scenario training. This training is representative of the unit mission tasking. Unit planners should ensure exercises are planned and flown to maximize training objectives.

19.5.2. Objectives. Tactics training should be integrated into each exercise during the planning stage. Training objectives include, but are not limited to tactical deception, threat advisories, and defensive tactics. Consider the following elements during exercise planning:

19.5.2.1. Utilize warning, alerting, deployment and execution orders.

19.5.2.2. Theater OPORD/SPINS/ATOs should be sent by secure comm/data means during day of exercise.

19.5.2.3. Conventional exercises should stress the “ability to survive and operate” (ATSO) in a chemical environment as much as possible within the constraints of unit equipment, budget, and supplies.

19.6. Tactical Operations Employment. Reference MDS-specific AFTTPs.

19.7. Tactical Evaluations. Evaluation of aircrew tactics should validate the unit tactics training as specified in AFI 11-2SAMV2.

19.8. Prescribed Forms.

AF Form 4084, *Mission Planning Worksheet*

AF Form 4085, *Mission Expense Record*

19.9. Adopted Forms.

AF Form 8, *Certificate of Aircrew Qualification*

AF Form 15, *United States Air Force Invoice*

AF Form 72, *Air Report (AIREP)*

AF Form 457, *USAF Hazard Report*

AF Form 651, *Hazardous Air Traffic Report (HATR)*

AF Form 664, *Aircraft Fuels Documenting Log*

AF Form 673, *Air Force Publication/Form Action Request*

AF Form 711B, *USAF Mishap Report*

AF Form 847, *Recommendation for Change of Publication*

(Added-MACDILLAFB) BWC—Bird Watch Conditions
C2—Command and Control
CAOC—Combined Air Operations Center
(Added-MACDILLAFB) CAPS—Critical Action Procedures
CBTA—Chemical-Biological Threat Area
CCA—Contamination Control Area
CDI—Course Deviation Indicator
CDS—Commercial Dispatch Service
CDT—Crew Duty Time
CECR—Crew Enhancement Crew Rest

CFP—Computer Flight Plan

CFR—Code of Federal Regulations

CIRVIS—Communications Instructions for Reporting Vital Intelligence Sightings

CG—Center of Gravity

(Added-MACDILLAFB) CJCS—Chairman of the Joint Chiefs of Staff

CLS—Contracted Logistics Support

CND—Could Not Duplicate

CNDC—Canadian National Defense Contract

CNS/ATM—Communications, Navigation, Surveillance/Air Traffic Management

(Added-MACDILLAFB) COCOM—Combatant Commander

CODEL—Congressional Delegation

COMBS—Contractor Operated Maintenance Base Supply

COMSEC—Communications Security

CONOPS—Concept of Operations

CONUS—Continental United States

CP—Command Post

CPDLC—Controller to Pilot Datalink Capability

CPI—Crash Position Indicator

CRM—Cockpit/Crew Resource Management

CSM—Command Support Missions

CSO—Communications System Operator

CSS—Concurrent Servicing Supervisor

CVAM—Special Air Missions Office

(MACDILLAFB) CVAM—Office of Assistant Vice Chief of Staff, USAF

CVR—Cockpit Voice Recorder

CW—Chemical Warfare

DA—Decision Altitude

DAA—Designated Approval Authority

DAO—Defense Attaché Office

DCS—Defense Courier Service

DER—Departure End of Runway

DESC—Defense Energy Support Center

DFSC—Defense Fuel Supply Center
DH—Decision Height
DNIF—Duty Not Including Flying
DoD—Department of Defense
DS—Defensive System
DSN—Defense Switching Network
DSO—Data Systems Operator
DV—Distinguished Visitor
DVG—Distinguished Visitor Guard
EAC—Enlisted Aircrew Coordinator
EACN—Executive Airlift Communications Network
EFB—Electronic Flight Bag
ELT—Emergency Locator Transmitter
EMC—Electromagnetic Compatibility
EMI—Electromagnetic Interference
EP—Evaluator Pilot
ERO—Engines Running Onload/Offload
EROPS—Extended Range Operations
ETA—Estimated Time of Arrival
ETB—Estimated Time of Block-in/Block-out
ETD—Estimated Time of Departure
ETIC—Estimated Time In Commission
ETP—Equal Time Point
EVS—Enhanced Vision System
FA—Flight Attendant
FAA—Federal Aviation Administration
FAF—Final Approach Fix
FBO—Fixed Base Operator
FCB—Flight Crew Bulletin
FCC—Federal Communications Commission
FCC—Flying Crew Chief
FCF—Functional Check Flight

FCG—Foreign Clearance Guide

FCIF—Flight Crew Information File

FCM—Flight Crew Manual

FDP—Flight Duty Period

FDR—Flight Data Recorder

FE—Flight Engineer

(Added-MACDILLAFB) FF—Basic Aircraft Qualification Flight Engineer

FIH—Flight Information Handbook

FIR—Flight Information Region

FLIP—Flight Information Publication

FM—Flight Manager

FMC—Flight Management Computer

(Added-MACDILLAFB) FMP—Flight Manuals Program

FMS—Flight Management System

FOM—Flight Operations Manual

FS—Flight Surgeon

FSO—Flight Safety Officer

FSS—Flight Service Station

FOD—Foreign Object Damage

(Added-MACDILLAFB) GAC—Gulfstream Aerospace Corporation

GCE—Ground Crew Ensemble

GDSS—Global Decision Support System

GNOC—Government Network Operations Center

GP—General Planning

GPS—Global Positioning System

HAA—Height Above Aerodrome

HAT—Height Above Touchdown

HATR—Hazardous Air Traffic Report

HF—High Frequency

HFGCS—High Frequency Global Communications System

(Added-MACDILLAFB) HOTREPS—Hot Reports

HR—Human Remains

IA—Information Assurance

IAW—In Accordance With

ICAO—International Civil Aviation Organization

ICS—Infant Car Seat

IFF—Identification Friend or Foe

IFM—Integrated Flight Management

IFR—Instrument Flight Rules

ILS—Instrument Landing System

IMC—Instrument Meteorological Conditions

IMT—Information Management Tool

INS—Inertial Navigation System

IP—Instructor Pilot

IRS—Inertial Reference System

ISSO—Information Systems Security Officer

JFTR—Joint Federal Travel Regulation

JOG—Joint Operational Graphic

JOSAC—Joint Operational Support Airlift Center

LAN—Local Area Network

LFA—Legal For Alert

LNAV—Lateral Navigation

LOA—Letter of Agreement

LRC—Long Range Cruise

MAF—Mobility Air Forces

MAG—Military Assistance Group

(MACDILLAFB) MAG—Mission Assessment Group

MAP—Missed Approach Point

MARSA—Military Assumes Responsibility for Separation of Aircraft

MC—Mission Contributing

(Added-MACDILLAFB) MCI-E—Military Customs Inspectors – Excepted

MDA—Minimum Descent Altitude

MDS—Mission Design Series

ME—Mission Essential

MEA— Minimum Enroute Altitude
(Added-MACDILLAFB) MEGP—Mission Essential Ground Personnel
MEP—Mission Essential Personnel
MEL—Minimum Equipment List
MISREP—Mission Report
MLS—Microwave Landing System
MMEL—Master Minimum Equipment List
MMO—Mobility Mission Observer
MNPS—Minimum Navigation Performance Specifications
MOA—Minimum Operating Altitude
MOCA—Minimum Obstruction Clearance Altitude
MOPP—Mission Oriented Protective Posture
MR—Mission Ready
MSC—Multi Service Corporation
MSK—Mission Support Kit
MSL—Mean Sea Level
NACO—National Aeronautical Charting Office
NAF—Numbered Air Force
NAT—North Atlantic Track
NCOIC—Non-Commissioned Officer in Charge
NDB—Non Directional Beacon
NGA—National Geospatial-Intelligence Agency
NIPR—Unclassified But Sensitive Internet Protocol Router
NMC—Not Mission Capable
NMCC—National Military Command Center
NMR—Non-Mission Ready
NOTAM— Notice to Airmen
NSA— National Security Agency
(Added-MACDILLAFB) NSTR—Nothing Significant to Report
OCF—Operational Check Flight
OCONUS—Outside the CONUS
OCS—Obstacle Clearance Surface

OEI—One Engine Inoperative
OI—Open Item
(MACDILLAFB) OI—Operating Instruction
OME—Operational Mission Evaluation
ONC—Operational Navigation Chart
OPC—Oceanic Plotting Chart
OPCON—Operational Control
OPLAN—Operations Plan
OPORD—Operations Order
OPR—Office of Primary Responsibility
ORM—Operational Risk Management
OSA—Operational Support Airlift
OSD—Office of the Secretary of Defense
OST—Off-Station Trainer
OWS—Operational Weather Squadron
PA—Public Address
PAG—Presidential Airlift Group
PAR—Precision Approach Radar
PDA—Personal Digital Assistant
PED—Portable Electronic Device
(Added-MACDILLAFB) PEX—Patriot Excalibur
PF—Pilot Flying
PFPS—Portable Flight Planning System
PIC—Pilot in Command
PL—Protection Level
PM—Pilot Monitoring
PMC—Partial Mission-Capable
PMCR—Post Mission Crew Rest
PMSV—Pilot to Meteorologist Service
POC—Point of Contact
POL—Petroleum, Oil and Lubricants
PRP—Personnel Reliability Program

QRC—Quick Reaction Checklist

RA—Resolution Advisory

RAIM—Receiver Autonomous Integrity Monitoring

RCR—Runway Condition Reading

(Added-MACDILLAFB) RDS—Records Disposition Schedule

(Added-MACDILLAFB) RMI—Radio Magnetic Indicator

RNAV—Area Navigation

RNP—Required Navigation Performance

ROC—Required Obstacle Clearance

RON—Remain Overnight

RSC—Runway Surface Condition

RTRB—Realistic Training Review Board

RVSM—Reduced Vertical Separation Minimum

SAAM—Special Assignment Airlift Mission

SAM—Special Air Mission

SATCOM—Satellite Communication

SDF—Simplified Directional Facility

SEB—Stan/Eval Board

(Added-MACDILLAFB) SECDEF—Secretary of Defense

(Added-MACDILLAFB) SECSTATE—Secretary of State

SELCAL—Selective Calling

SF—Standard Form

SID—Standard Instrument Departure

SIF—Selective Identification Feature

SIGMET—Significant Meteorological Information

SIPR—Secret Internet Protocol Router

(Added-MACDILLAFB) SITREPS—Situation Reports

SMGCS—Surface Movement Guidance and Control System

SOC—Squadron Operations Center

(Added-MACDILLAFB) SOP—Standard Operating Procedures

SPINS—Special Instructions

SPR—Single Point Refueling

STAR—Standard Terminal Arrival Route

TA—Traffic Advisory

TAAD—Tactical Arrival and Departure

TACAN—Tactical Air Navigation

TACC—Tanker/Airlift Control Center

TCAS—Traffic Alert and Collision Avoidance System

TDY—Temporary Duty

TERPS—Terminal Instrument Procedures

TO—Technical Order

TOLD—Takeoff and Landing Data

TPC—Tactical Pilotage Chart

TRB—Tactics Review Board

TWG—Threat Working Group

UIR—Upper Flight Information Region

(Added-MACDILLAFB) U.S.C.—United States Code

VFR—Visual Flight Rules

VIP—Very Important Person

VMC—Visual Meteorological Conditions

VNAV—Vertical Navigation

VOR—Very High Frequency Omni-Directional Radio-Range

WEZ—Weapons Engagement Zone

WHCA—White House Communications Agency

WHMO—White House Military Office

Terms: *Common mobility terms and associated abbreviation. Additional terms common to the aviation community may also be found in FAR, Part 1 and DoD FLIP, General Flight Planning, chapter 2.*

Advance Notice Message—A message dispatched when required by the FCG to provide advance notification to interested agencies of mission itinerary and support requirements. It may be combined with a diplomatic clearance request message.

Aeromedical Evacuation Coordination Center (AECC)—A coordination center, within the Joint Air Operations Center, which monitors all activities related to aeromedical evacuation (AE) operations execution. It manages the medical aspects of the AE mission and serves as the net control station for AE communications. It coordinates medical requirements with airlift capability, assigns medical missions to the appropriate AE elements, and monitors patient movement activities.

Aircrew Threat Advisory—An intelligence message containing information about a situation which may pose a direct threat to MAF aircrews.

Air Force Satellite Communication (AFSATCOM)—Satellite communications system capable of 75 bits per second (BPS) record message traffic.

Air Force Component Commander (AFCC)—In a unified, sub-unified, or joint task force command, the Air Force commander charged with the overall conduct of Air Force air operations. Also referred to as commander, Air Force forces (COMAFFOR).

Aircraft Security NCO (ASNCO)—Security Forces personnel assigned as integral members of SAM aircrews to protect Presidential, Presidential Support, and SDSAM aircraft and associated personnel and equipment. See chapter 15 of this AFI for an amplified explanation.

Airlift—Aircraft is considered to be performing airlift when manifested passengers or cargo are carried.

Air Mobility Control Center (AMCC)—Provides global coordination of tanker and airlift for AMC and operationally reports to the TACC. Functions as the AMC agency that manages and directs ground support activities and controls aircraft and aircrews operating AMC strategic missions through overseas locations.

Air Mobility Element—(DoD) The air mobility element is an extension of the Air Mobility Command Tanker Airlift Control Center deployed to a theater when requested by the geographic combatant commander. It coordinates strategic airlift operations with the theater airlift management system and collocates with the air operations center whenever possible (also called AME).

Air Mobility Division (AMD)—Provides global coordination of tanker and airlift for USAFE and PACAF MAFs. Functions as the agency that manages and directs air and ground support activities and controls aircraft and aircrews operating USAFE/PACAF strategic missions through overseas locations.

Air Reserve Component (ARC)—Refers to Air National Guard and AFRC forces, both Associate and Unit Equipped.

Antarctic Flight—Flight conducted south of 56 degrees south latitude.

Arctic Flight—Flight conducted between 15 degrees and 180 degrees west longitude (exclusive of Iceland) north of 50 degrees north latitude between 1 October and 15 April. Transoceanic flights are excluded.

Arrival Time—The block-in time, rather than the landing time.

Air Route Traffic Control Center (ARTCC)—The principal facility exercising en route control of aircraft operating under instrument flight rules within its area of jurisdiction. Approximately 26 such centers cover the United States and its possessions. Each has a communication capability to adjacent centers.

Air Traffic Control (ATC)—A service operated by appropriate authority to promote the safe, orderly and expeditious flow of air traffic.

Alert Aircraft/Crew.—A designated aircraft and crew capable of launching on a mission within a predetermined period of time beginning with launch notification from C2.

Allowable Cabin Load (ACL)—The maximum payload which can be carried on a mission. It is the difference between the zero fuel weight limit and the aircraft operating weight.

Augmented Crew—Basic aircrew supplemented by additional qualified aircrew members to permit in-flight rest periods as defined in chapter 3 of this AFI.

Avisource—Interactive computer database system used by USAF/CVAM to schedule and manage VIP Missions.

BAM—Bird Avoidance Model at website <http://www.usahas.com>.

Bird Aircraft Strike Hazard (BASH)—An Air Force program designed to reduce the risk of bird strikes.

Bird Condition Low—No significant bird activity which would present a probable hazard to flying operations. No operating restrictions.

Bird Condition Moderate—Concentrations of 5 to 15 large birds (waterfowl, raptors, gulls, etc.) or 15 to 30 small birds (terns, swallows, etc.) observable in locations that represent a probable hazard to flying operations.

Bird Condition Severe—Concentrations of more than 15 large birds (waterfowl, raptors, gulls, etc.) or more than 30 small birds (terns, swallows, etc.) observable in locations that represent a probable hazard to flying operations.

Block Time—Time determined by the scheduling agency responsible for mission accomplishment for the aircraft to arrive at (block in) or depart from (block out) the parking spot. “Block Time” may be defined as the time the door will open on arrival.

BLUE BARK—US military personnel, US citizen civilian employees of the DoD, and the dependents of both categories who travel in connection with the death of an immediate family member. It also applies to designated escorts for dependents of deceased military members. Furthermore, the term is used to designate the personal shipment of a deceased member.

Border Clearance—Those clearances and inspections required to comply with federal, state, and local agricultural, customs, immigration, and immunizations requirements.

Class II Airspace—Long-range navigation beyond the limits of the operational service volume of ground-based NAVAIDS (formerly known as a Category I route).

CLOSE HOLD—USAF term assigned to all aspects of a DV airlift when destination, passengers’ names, or other mission details are restricted from general release.

COIN ASSIST—Nickname used to designate dependent spouses accompanying dependent children and dependent parents of military personnel reported missing or captured who may travel space available on military aircraft for humanitarian purposes on approval of the Chief of Staff, United States Army; Chief of Staff, United States Air Force; Chief of Naval Operations; or the Commandant of the Marine Corps.

Commander Support Missions (CSM)—DV Missions supporting Combatant, Unified and Sub-unified Commanders in 4 star positions. CSMs are authorized CVAM/AMD support.

Command and Control (C2)—The exercise of authority and direction by a properly designated commander over assigned and attached forces in the accomplishment of the mission. C2 functions are performed through an arrangement of personnel, equipment, communications,

facilities, and procedures employed by a commander in planning, directing, coordinating, and controlling forces and operations in the accomplishment of the mission.

Command and Control Center (C2 center)—Each C2 center provides supervision, guidance, and control within its assigned area of responsibility. For the purpose of this AFI, C2 centers including operations centers, CPs, air mobility elements, tanker airlift control elements (TALCE), air mobility control centers, and tanker task forces.

Command and Control Information Processing System (C2IPS)—Computer-based information transmission and information handling for C2 functions associated with the Director of Mobility Forces (DIRMOBFOR), AME fixed units, and TALCE. Interfaces to and automatically updates the Global Decision Support System (GDSS).

Communications Systems Operator (CSO)—Flight crewmember responsible for inspecting, operating, and maintaining all communications and electronic equipment aboard the aircraft. See chapter 14 of this AFI for an amplified explanation.

CONFERENCE SKYHOOK—Communication conference available to help aircrews solve in-flight problems that require additional expertise. Contact C2 centers to establish links with unit Stan/Eval, Maintenance, Contract Logistics Support and Systems Programs Technicians.

Contingency Mission—Mission operated in direct support of an OPORD, OPLAN, disaster, or emergency.

Critical Leg—The segment of a mission that determines the ACL which may be carried over that route.

Critical Phase Of Flight—Takeoff, air refueling, formation below minimum safe altitude, low level, airdrop, approach, and landing.

CVAM (Special Air Missions Office)—Agency within the office of the USAF Vice Chief of Staff responsible for scheduling and committing all Air Force airlift required to support the White House or any other executive branch of the government. The single coordinating agent for AMC and AMC-gained VIP Aircraft fleet and schedules AMC and AMC-gained VIP Missions.

Deadhead Time—Duty time for crewmembers in passenger status, positioning or de-positioning for a mission or mission support function.

Departure Time—The block-out time, rather than the takeoff time.

Designated Courier.—Officer or enlisted member in the grade of E-5 or above of the US Armed Forces, or a Department of State diplomatic courier, selected by the Defense Courier Service (DCS) to accept, safeguard, and deliver DCS material as directed. A primary aircrew member should be used as a courier only as a last resort.

Diplomatic Clearance Request Message—A message dispatched to request diplomatic clearance for over-flight and/or transit of foreign territories. Message content and addresses are specified in the FCG. This message is usually combined with the advance notice message.

Direct Instructor Supervision—Supervision by an instructor of like specialty with immediate access to controls (for pilots, the instructor must occupy either the pilot or copilot seat).

Director of Mobility Forces (DIRMOBFOR)—Normally a senior officer who is familiar with the area of responsibility or joint operations area and possesses an extensive background in air mobility operations. When established, the director of mobility forces serves as the designated agent for all air mobility issues in the area of responsibility or joint operations area, and for other duties as directed. The director of mobility forces exercises coordinating authority between the air operations center (or appropriate theater command and control node), the tanker airlift control center, the air mobility operations control center (when established and when supporting subordinate command objectives), and the joint movement center, in order to expedite the resolution of air mobility issues. The director of mobility forces may be sourced from the theater's organizations or US Transportation Command. Additionally, the director of mobility forces, when designated, will ensure the effective integration of intertheater and intratheater air mobility operations, and facilitate the conduct of intratheater air mobility operations. Also called DIRMOBFOR. (JP 3-30)

Dispatch—Dispatch is defined as the start of takeoff roll.

Distinguished Visitor (DV)—Passengers, including those of friendly nations, of colonel rank and higher, or equivalent status including diplomats, cabinet members, members of Congress, and other individuals designated by the DoD due to their mission or position (includes BLUE BARK and COIN ASSIST).

Distinguished Visitor/HFGCS Message (DV Message)—A classified message dispatched with the DV's name/status code and mission number. This message also establishes HFGCS priority and requests HFGCS network and support. This message is usually sent with the advance notice and diplomatic clearance request message.

Diverse Departure—The airfield has been assessed for departure by TERPS personnel and no penetration of the obstacle surfaces exists. An aircraft may depart the field, climb to 400 feet above the departure end of the runway elevation, turn in any direction, and if a minimum climb gradient of 200'/NM is maintained, be assured of obstacle clearance. This is normally indicated on DoD/NOAA publications by the absence of any published departure procedures.

Due Regard—Operational situations that do not lend themselves to International Civil Aviation Organization (ICAO) flight procedures, such as military contingencies, classified missions, politically sensitive missions, or training activities. Flight under "Due Regard" obligates the military PIC to be his or her own ATC agency and to separate his or her aircraft from all other air traffic (See *FLIP GP*, section 7).

Enlisted Aircrew Coordinator (EAC)—The appointed NCO crewmember (not necessarily the ranking) tasked with coordinating all enlisted aircrew issues and concerns in regards to a particular mission. Enlisted crewmembers should attempt to resolve most issues and concerns with the EAC who in turn reports to the PIC.

Equal Time Point (ETP)—The point along a route at which an aircraft may either proceed to the destination/first suitable airport, or return to the departure base/last suitable airport in the same amount of time. It may be based on all engines operating or with one engine inoperative.

Estimated Time of Arrival (ETA)—Same as estimated block-in time. Landing time is different than ETA.

Estimated Time of Block-in/Block-out (ETB)—Same as estimated time aircraft door will open for arrival or close for departure.

Estimated Time of Departure (ETD)—Same as Estimated Time of Block-out. Takeoff time is different than departure time.

Estimated Time In Commission (ETIC)—Estimated time required to complete required maintenance.

Extended Range Operations (EROPS)—For twin engine aircraft, those flights conducted over a route containing a point further than 60 minutes flying time at the one-engine inoperative cruise speed (under standard conditions in still air) from a suitable en route alternate.

Familiar Field—An airport in the local flying area at which unit assigned aircraft routinely perform transition training. Each operations group commander will designate familiar fields within their local flying area. See local supplement for approved fields and limitations.

First Pilots—First pilots are highly experienced pilots who are qualified IAW volumes 1 and 2 of this instruction to taxi, takeoff, and land the aircraft from the left seat under the supervision of a qualified VIP AC.

Flight Attendants (FA)—Flight crewmember to provide cabin service, instruct passengers in the use of emergency equipment, direct and control passengers under emergency conditions, and maintain cabin cleanliness. See chapter 13 of this AFI for an amplified explanation.

Global Decision Support System (GDSS)—MAF's primary execution C2 system. GDSS is used to manage the execution of MAF airlift and tanker missions.

Global Patient Movement Requirements Center—A joint activity reporting directly to the Commander in Chief, US Transportation Command, the DoD single manager for the regulation of movement of uniformed services patients. The Global Patient Movement Requirements Center authorizes transfers to medical treatment facilities of the Military Departments or the Department of Veterans Affairs and coordinates inter theater and CONUS patient movement requirements with the appropriate transportation component commands of US Transportation Command.

Ground Time—Interval between engine shut down and next takeoff time. For VIP Missions this normally is defined as the interval between VIP door open on arrival and VIP door close on departure.

Hazardous Cargo or Materials—Articles or substances that are capable of posing significant risk to health, safety, or property when transported by air. These articles or substances are classified as explosive (class 1), compressed gas (class 2), flammable liquid (class 3), flammable solid (class 4), oxidizer and organic peroxide (class 5), poison and infectious substances (class 6), radioactive material (class 7), corrosive material (class 8), or miscellaneous dangerous goods (class 9). Classes may be subdivided into divisions to further identify hazard, i.e., 1.1, 2.3, 6.1, etc.

High Frequency Global Communications System (HFGCS)—Worldwide high frequency (HF) network tied together with high quality, dedicated, intersite circuits to provide worldwide communication capability for high ranking government officials. When activated for a mission, the master net control station at Andrews AFB has the capability to remotely seize control of HF

equipment at various locations; therefore, the airborne operator is always in contact with the operator at Andrews. HFGCS service is only provided for certain missions.

Hotel Reservation Message (HOTRES)—A message dispatched to request crew accommodations and transportation per the scheduled mission itinerary. This message is usually combined with the advance notice message and diplomatic clearance request message.

Instructor Supervision—Supervision by an instructor of like specialty. For critical phases of flight, the instructor must occupy one of the seats or stations, with immediate access to the controls.

Itinerary Change Message (Itin Change)—A message dispatched to change the original itinerary, due to changes in the scheduled mission, published in the original advance notice message or diplomatic clearance message.

L-Band SATCOM—600 BPS SATCOM system contracted through the International Maritime Satellite Organization (INMARSAT), used primarily for C2. The system consists of a satellite transceiver, a laptop computer, and a printer.

Landing Status Codes:—When possible, identify system as Mission Essential (ME) or Mission Contributing (MC).

Code 0: Ground Abort

Code 1: Aircraft is Mission Capable with no additional discrepancies

Code 2: Aircraft or system has major discrepancies, but is capable of further mission assignment within normal turnaround times.

Code 3: Aircraft or system has major discrepancies in mission essential equipment that may require extensive repair or replacement prior to further mission assignment. The discrepancy may not affect safety—of-flight and the aircraft may be Not Mission Capable (NMC) flyable.

Code 4: Aircraft or system has suspected or known radiological, chemical, or biological contamination.

Code 5: Aircraft or system has suspected or known battle damage.

Leg Time—Time between door closed on departure to door open on arrival.

Local Training Mission—A mission scheduled to originate and terminate at home station, generated for training or evaluation, and executed at the local level.

Meal—Any service that involves preparation and/or cooking of cold and/or hot food items. Serving pre-packaged food and/or drink items (such as pretzels, chips, or sodas) does not constitute a meal.

Mission—The task, together with the purpose, that clearly indicated the action to be taken and the reason therefor. In common usage, especially when applied to lower military units, a duty assigned to an individual or unit; a task. The dispatching of one or more aircraft to accomplish one particular task.

Mission Advisory—Message dispatched by C2 agencies, liaison officers, or PICs advising all interested agencies of any changes in status affecting the mission.

Mobility Air Force (MAF)—Forces assigned to mobility aircraft or MAJCOMs with operational or tactical control of mobility aircraft.

Operational Control (OPCON)—Transferable command authority that may be exercised by commanders at any echelon at or below the level of combatant command. OPCON is inherent in combatant command (command authority). OPCON may be delegated and is the authority to perform those functions of command over subordinate forces involving organizing and employing commands and forces, assigning tasks, designating objectives, and giving authoritative direction over all aspects of military operations and joint training necessary to accomplish missions assigned to the command. OPCON should be exercised through the commanders of subordinate organizations. Normally this authority is exercised through subordinate joint force commanders and Service and/or functional component commanders. OPCON normally provides full authority to organize commands and forces and to employ those forces as the commanders in OPCON considers necessary to accomplish assigned missions. OPCON does not, in and of itself, include authoritative direction for logistics or matters of administration, discipline, internal organization, or unit training.

Operational Missions—Missions executed at or above MAJCOM C2 level. Operational missions termed "Close Watch" include CORONET missions and AFI 11-221, *Air Refueling Management (KC-10 and KC-135)*, priority 1, 2, and 3 missions tasked by the MAJCOM C2. Other operational missions such as deployment, re-deployment, reconnaissance operations, operational readiness inspections (ORI), channel or SAAM, and JA/ATT missions may be designated "Close Watch" as necessary.

Opportune Airlift—Transportation of personnel, cargo, or both aboard aircraft with no expenditure of additional flying hours to support the airlift.

Originating Station—Base from which an aircraft starts on an assigned mission. May or may not be the home station of the aircraft.

Operational Risk Management (ORM)—ORM is a logic based, common sense approach to making calculated decisions on human, material, and environmental factors before, during, and after all operations. USAF policy on ORM is contained in AFD 90-9. PICs will accomplish ORM worksheets IAW MAJCOM and local guidance as part of preflight activities (see [paragraph 6.24](#) of this AFI).

Operational Support Airlift Mission (OSA)—Movements of high-priority passengers and cargo with time, place, or mission-sensitive requirements.

Overwater Flight—Any flight that exceeds power off gliding distance from land.

Permit to Proceed—Aircraft not cleared at the first US port of entry may move to another US airport on a permit to proceed issued by customs officials at the first port of entry. This permit lists the requirements to be met at the next point of landing, i.e. number of crew and passengers, cargo not yet cleared. PICs are responsible to deliver the permit to proceed to the customs inspector at the base where final clearance is performed (Heavy monetary fines can be imposed on the PIC for not complying with permit to proceed procedures).

Point of No Return—A point along an aircraft track beyond which its endurance will not permit return to its own or some other associated base on its own fuel supply.

Point of Safe Return—Most distant point along the planned route from which an aircraft may safely return to its point of departure or alternate airport with required fuel reserve.

Positioning and De-positioning Missions—Positioning missions are performed to relocate aircraft for the purpose of conducting a mission. De-positioning missions are made to return aircraft from bases at which missions have terminated.

Presidential Aircraft—Any aircraft used to transport the President of the United States, or designated as a Presidential Aircraft by White House Military Office through the PAG. Presidential Aircraft require continuous security protection at home station, en route operating locations, and contract maintenance facilities. Other aircraft may be temporarily upgraded to Presidential aircraft security status for a particular mission.

Presidential Airlift Mission—A category of operational missions involving or supporting transport of the President of the United States. Does not include training missions.

Quick Stop—Set of procedures designed to expedite the movement of selected missions by reducing ground times at en route or turnaround stations.

Ramp Coordinator—Designated representative of the C2 center whose primary duty is the coordination of ground handling activities on the ramp during large scale operations.

Ramp Freeze—Term used at Andrews AFB to denote a set of security procedures within a fixed geographical area on the flight line to ensure the safety of high-level DVs. Generally, all vehicular traffic is prohibited in a designated area except for security police and personnel and vehicles directly supporting the departing or arriving DV. Refer to AAFBR 900-6 for further information.

RAVEN—Air Force Security personnel specially trained for aircraft protection.

VIP Delay—A VIP delay occurs when the DV and accompanying party is ready for departure and the DV's departure is delayed due to maintenance or operational reasons.

Scheduled Takeoff Time—That time established in the mission itinerary for departure.

Scheduled Return Date (SRD)—Scheduling tool used by air mobility units to predict when crews will return to home station. It allows force managers to plan aircrew availability and provide crews visibility over monthly flying activities. AMC and AMCGained aircrews (except those on standby at home station) will have an SRD established on their flight orders.

Significant Meteorological Information (SIGMET)—Area weather advisory issued by an ICAO meteorological office relayed to and broadcast by the applicable ATC agency. SIGMET advisories are issued for tornadoes, lines of thunderstorms, embedded thunderstorms, large hail, severe and extreme turbulence, severe icing, and widespread dust or sand storms. SIGMETs frequently cover a large geographical area and vertical thickness. They are prepared for general aviation and may not consider aircraft type or capability.

Special Air Mission (SAM)—Missions tasked and scheduled at the direction of USAF/CVAM.

Special Assignment Airlift Mission (SAAM)—Airlift requirements for special pick -up or delivery by AMC at points other than established AMC routes, and which require special consideration because of the number of passengers involved, the weight or size of the cargo, the urgency or sensitivity of movement, or other special factors. A SAAM can be flown by any appropriate unit and is not the same as a SAM mission.

Specifically Designated Special Air Mission (SDSAM)—Any mission specifically identified by USAF/CVAM as requiring special security procedures.

Squadron—Refers to VIP fixed -wing aircraft squadrons within the MAF.

Stations Time—Normally, 30 minutes prior to departure time. Aircrews will have completed their pre -flight duties/appropriate checklists, and be at their crew positions.

618 th TACC—The Air Mobility Command direct reporting unit responsible for tasking and controlling operational missions for all activities involving forces supporting US Transportation Command's global air mobility mission. The Tanker Airlift Control Center is comprised of the following functions: current operations, C2, logistics operations, aerial port operations, aeromedical evacuation, flight planning, diplomatic clearances, weather, and intelligence.

Tanker Airlift Control Element (TALCE)—Team of qualified Air Force personnel established to control, coordinate, and function as an Air Force tanker and airlift C2 facility at a base where normal AMC C2 facilities are not established or require augmentation. TALCEs support and control contingency operations on both a planned and no-notice basis.

Tanker Task Force (TTF)—Force of tanker aircraft assembled and tasked to perform a specific function.

Theater Patient Movement Requirements Center (TPMRC)—The TPMRC is responsible for theater wide patient movement (e.g., medical regulating and AE scheduling), and coordinates with theater MTFs to allocate the proper treatment assets required to support its role. The primary role of the TPMRC is to devise theater plans and schedules and then monitor their execution in concert with the GPMRC. The TPMRC is responsible to the Combatant Commander through the Combatant Command Surgeon. The TPMRC is also responsible for all aspect of intra-theater patient movement management. A TPMRC provides C2 for patient movement management operations in its theater of operations, as directed by its Combatant Commander's operational policy, and in coordination with USTRANSCOM, acting as a supporting combatant command, responsible for inter-theater and CONUS patient movement.

Time Out—Common assertive statement used to voice crewmember concern when safety may be jeopardized.

Training Mission—Mission executed at the wing level or below for the primary purpose of aircrew training for upgrade or proficiency. Synonymous with non -operational mission. Does not include operational missions as defined in this AFI.

Unescorted Entry List—Computerized lists of personnel authorized unescorted entry to Presidential, Presidential Support, and certain other OSA/VIPSAM missions to perform their duties. Unescorted Entry Lists are also categorized to indicate individuals authorized to escort personnel onto aircraft, and individuals authorized to grant escorted entry to the aircraft. Unescorted Entry List categories are published in AFI 31-101.

Unit Move—Unit relocation in support of a contingency or exercise deployment/redeployment. These moves are made to desired areas of operation or to designated locations, and are made IAW a troop movement schedule.

Validation Authority—The agency or office tasked to review and approve/disapprove a proposed airlift requirement.

VIP Aircraft—Aircraft tasked to perform a VIP mission.

VIP Mission—A category of operational mission that includes Special Airlift Missions (SAM), Commander Support Missions (CSM), Distinguished Visitor Guard (DVG) missions and Distinguished Visitor (DV) missions to include Presidential Airlift Missions tasked through the White House Military Office (WHMO), and DV missions tasked through the Office of Assistant Vice Chief of Staff (HQ USAF/CVAM), Theater Air Mobility Divisions (AMD) and the Joint Operational Support Airlift Center (JOSAC). Does not include training missions.

White House Communications Agency (WHCA)—A joint service field unit of the Defense Information Service Agency (DISA) which provides communications support for the White House.

Zero Fuel Weight (Actual)—Weight, expressed in pounds, of a loaded aircraft not including wing and body tank fuel. All weight in excess of the maximum zero fuel weight will consist of usable fuel.

Zero Fuel Weight (Maximum)—The weight expressed in pounds where an addition to the aircraft gross weight can be made only by adding fuel in the tanks. This value is called “Limiting Wing Fuel” on the DD Form 3654, Weight and Balance Clearance Form.

Attachment 2 (Added-MACDILLAFB)

MISSION BRIEFING GUIDE

Aircraft Commander (Mission Overview)

- Mission #//Latest Version//Itinerary
- Call Sign//Aircraft #//Fuel load
- DV Title & Name//Pax Load (ealeg)//Space-A Release
- Show//Stations//Departure Time
- Uniform/Civilian Clothing Req
- Weather Overview
- Paying Agent (Cash Req/Coord'd)
- Aircraft Cleanliness
- Training & Evaluations
- Honors/Hard/Quiet Arrivals & Timing

Flight Engineer

- Aircraft Security (en route stops)
- Aircraft Servicing Req (Fuel, Lav, Potable Water: *How to Pay?*)
- Performance issues//limitations
- Arming Requirements
- Travel Orders/DTS
- Aircraft keys

Communications Systems Operator

- Comm/Crypto Req (IFF Mode 2/4)
- Shot records/Passports
- Per Diem Estimates/Billeting
- Trans/Rental Cars (Who's driving?/Map printouts & directions to lodging)
- Base Passes (if req)
- Crew contact card/AviSource Logi cut
- Review Duress Words w/ crew

Normal Procedures

- Cockpit Discipline (below 10,000')
- Clearing (Visual//TCAS//Radios)
- CRM: Keep crew informed of problems
"Timeout"

Most conservative response

Emergency Egress

- Primary/Secondary Exits
- Head Count before Taxi
- Cockpit callout: 3 X 'Brace'/3 X 'Evacuate'
- Planned vs. Unplanned

Info front to back & back to front

NTSB (Brief FA)

Nature of situation

Special Instructions

Time to ldg/ditching

Brac/Evac Signals

Overwater/Ditching Procedures

- HMG Check
- Ditching Matrix (Vol IV, App H)
- Window exiting//Raft deployment
- Gather up supplies

Personal Requirements

- SIIs//Gnd & Flight Currency
- PEX (FCIF & RF #s//e-Pubs date)
- Human Factors//ORM responsibilities
- Dog tags//Rings//Scarves
- GTC/Cash/Foreign Currency Considerations
- Aircraft Cell Phone
- Force Protection Issues

Flight Attendant

- POC Contact
- Customs/Border Clearance Req
- Special FCG//Immunizations Req
- Baggage Plan//All Bags Labeled
- Pax Manifesting
- Pax/Crew Meal Plan & Requests
- Un-manifested Packages//Sabotage/Stowaway Procedures
- AFTO Form 46 (*Prepositioned Life Support Equipment*) Responsibilities
- Wet Ice/Dry Ice Requirements (Dept & Arr)
- Who's on crew bill?

AOR Requirements

- Who's responsible for getting to acft?:
 - Blood chits//ISOPREP
 - Helmets//Vests//ALEPS//Chem gear
- Modes/Codes (process to receive enroute)
- Cmbt Entry & Exit/3-3 Plan
- Tactics Binder//OPORD & SPINS Reviews

Rules of the Road/Wrap-Up

- SAFETY 1st, passenger COMFORT 2nd, RELIABILITY 3rd
- Keep AC informed of activities
- Crew Expectations (Free Time)
- Questions//Comments//Concerns

INSTRUCTOR GUIDE**(Include Applicable MISSION BRIEFING GUIDE Items)****Instructor Preparation**

- Review Training Folder (sign out on pink AF Form 614, *Charge Out Record*)
- Review AF Form 8 (*Certification of Aircrew Qualification*) discrepancies (if applicable)
- Requisite items complete (if applicable)
- Review qualifications, currency, and other specific requirements
- Request student's inputs for profile (if applicable)
- Plan profile to fit training requirements (upgrade, proficiency, etc.)

Instructor Briefing

- (ALL) Explain the flight profile
 - (ALL) Designate seat assignments
 - (ALL) Brief training limitations/ restrictions
 - (ALL) Brief training standards (AFI 11-2VIP V2 criteria)
 - (P/FE) Simulated Vs Actual Emergencies (Termination Call)
 - (P/FE) Touch-&-Go Procedures (Ref AOM Vol IV, App D)
1. Mains down = Stand up throttles
 2. "Flaps and Trim Set" = "Push them up" (≥ 1.41 EPR)

3. TO/GA selected
4. “Rotate” ($\geq V_{\text{ref}}$) [Tech: Call “ V_{REF} , TO/GA, Rotate”]
5. Go/ No-Go point
6. Right seat landing briefing (gear & flap ops, etc)
7. Potential for ACFT CONFIG CAS message

- (ALL) Set realistic student goals

Specific to Student

- Brief non-standard actions along with reason (before you do it)
- Required pubs and pro gear
- Employ CRM (use other crewmembers as you normally would)
- (P) Assume weather is at minimums, (IP) Assume weather necessary for profile

Flight/Mission Debrief

- Recap//summary//overall performance (goal attainment)
- Area/sub-areas discrepancies
- Additional training (if required)//restrictions (if required)
- Recommendations for next training mission
- Questions/comments

Post Mission Paperwork

- Complete Training Folder//log events on MAR (if applicable)
- Ensure 4023 is complete in accordance with Trng Folder Guide
- Notify DO/DOT if performance & progress is UNSAT
- Coord w/ 310AS/DOV to sign AF Form 8 Additional Training (if applicable)

EVALUATOR GUIDE

Evaluator Preparation

- 310 AS/CC/DO/DOV chief notified prior to No-Notice *if possible*
- Recommendation ride properly documented (OPR: DOT)
- DO has reviewed/approved training folder
- Complete 310 AS Flight Evaluation Routing Folder Checklist Pre-Evaluation Actions steps and prepare AF Form 3862, *Flight Evaluation Worksheet*
- Confirm required currency items are up to date

Flight Examiner Briefing

- Type of Evaluation (RQ, INSTM/QUAL/MSN, N/N, etc.)
- Minimum requirements to complete the evaluation
- Grading IAW AFI 11-2VIP V2 criteria
- Area/Sub-areas: Q, Q-, or U
- Critical Areas (Specified items graded Q or U)
- Overall possible Grade: EQ, Q1, Q2, and Q3

Specific To Examinee

- Brief non-standard actions along with reason (before you do it)
- Required pubs (FLIP, e-pubs, etc.) and pro gear
- Employ CRM (use other crewmembers as you normally would)
- (P) Assume weather is at minimums, IP/EP will call runway in site

From Flight Examiner

- Explain role as safety observer for the flight/mission (radio calls, TCAS, etc.)
- Repeating maneuvers/task (do not read anything into request)
- I will take notes, good and bad
- I will not intentionally mislead

Flight/ Mission Debrief (CC/DO/Supervisor in attendance)

- Recap/summary (Present overall grade)
- Highlights (Area/sub-areas that were particularly noteworthy/commendable)
- Area/sub-areas discrepancies
- Additional training (if required)/Restrictions (if required)
- Expiration date/Complete requisites
- Recommendations

Post-mission Paperwork

- **Immediately** complete 310 AS Flight Evaluation Routing Folder Checklist Post-Evaluation Actions steps
- Savannah check rides: send e-mail w/3862 & status to 310as.dov2@macdill.af.mil or FAX to 813-828-7798
